

ABSTRACT

Embodiments of the present application provide a target object recognition
5 method and device, a storage medium, and an electronic apparatus. The target object
recognition method comprises: performing target object detection with respect to an
object of an image undergoing detection to acquire target object prediction
information of the object, wherein the target object prediction information indicates
the confidence that the object undergoing detection is the target object; performing
10 key point detection on the object of the image undergoing detection to acquire key
point prediction information of the object, wherein the key point prediction
information indicates the confidence that a key point of the object undergoing
detection is a key point of the target object; fusing the target object prediction
information with the key point prediction information to acquire consolidated
15 prediction information of the object; and performing recognition on the target object
according to the consolidated prediction information.
