CLAIMS

1. A resin made container comprising:

a spout portion acting as an outlet for contents;

a shoulder portion continuous with the spout portion;

a body portion continuous with the shoulder portion; and

a bottom portion continuous with the body portion and closing a lower end of the body portion;

wherein an intermediate portion of the body portion includes a plurality of approximately quadrangular shaped panel portions each having an upper side and a lower side thereof displaced;

between adjacent panel portions, a chevron-shaped rib is provided,

the chevron-shaped rib has an angle at an inner side thereof ranging from 90 to 160 degrees,

the intermediate portion has an approximately hexagonal cross section taken along a plane orthogonal to a center axis of the container, and

the respective panel portion has a parallelogram shape and widths of the respective panel portions are made equal.

2. The resin made container of claim 1, wherein the chevron-shaped rib has a sloped face which extends with a uniform width from the upper side to the lower side of the resin made container.

3. The resin made container of claim 1 or 2, wherein the panel portion includes, in at least one of its upper and lower parts, an annular receded rib which is receded to the inner side of the resin made container and which extends in a circumferential direction of the resin made container.
