ECO-INCINERATOR

DESCRIPTION

A brand new design of incinerator for incense burning with multi stage of burning. To achieve complete burning at a faster pace with the principle of air convection

Design comes with a top-cover, the main body, a inner net stand , interlayer and a ash collector.

With special air intake opening (refer attached drawing dc1 no 1) by using principle of air convection during burning and creating a circulation effect(refer attached drawing DC1 no 2) to bring all burnt particles down to the ashes collector.

Hot air rises from opening at the top cover (refer attached drawing dc1 no3) will promote acceleration in suction of air at the intake opening to continuously creating the circulation effect to accelerated burning.

Air convection principle on this design will also introduced cooling effect on main body to reduce high heat emission.

INCINERATION STAGES

Claims of patents

Claim for patent of : Incinerator Top cover

Claim for patent of: Incinerator main body

Claim for patent of: Net stand

Claim for patent of: Interlayer

Claim for patent of: Ashes collector

Claim for patent of: Air convection principle for complete burning process.

Claim for patent of: Air convection principle for control and contain burnt particles.

Claim for patent of: Air convection principle for cooling effect on incinerator main body.

Claim for patent of: Air convection principle for multi stage of incineration in a confine space.
