BUILT-IN AUTOMATIC CUSTOMER IDENTIFIER WHEN CONNECTING TO A VENDOR WEBSITE

Background

The disclosures herein relate generally to computer systems and more particularly to factory installed HTML to automatically identify a build-to-order customer when connecting to a web site.

This application relates to co-pending United States Patent Application Serial No. 09/012,196, filed on January 23, 1998, entitled System And Method For Preparing A Computer Memory, naming Alan E. Beelitz as inventor. The co-pending application is incorporated herein by reference in its entirety, and is assigned to the assignee of this invention.

This application relates to co-pending United States Patent Application Serial No. 09/012,962 filed on January 26, 1998, entitled Generation of a Compatible Order For a Computer System, naming Alan E. Beelitz and Paul J. Maia as inventors. The co-pending application is incorporated herein by reference in its entirety, and is assigned to the assignee of this invention.

This application relates to co-pending United States Patent Application Serial No. 09/009,401, filed on January 19, 1998, entitled

Method And Apparatus For Providing And Accessing Data At An Internet Site naming Amy Van Wyngarden as inventor. The co-pending application is incorporated herein by reference in its entirety, and is assigned to the assignee of this invention.

This application relates to co-pending United States Patent Application Serial No. 09/066,128, filed on April 24, 1998, entitled Method And System For Supplying A Custom Software Image To A Computer System naming Tom Colligan, Jonathan Ellis and Hunter Robertson as inventors. The co-pending application is incorporated herein by reference in its entirety, and is assigned to the assignee of this invention.

When an off-the-shelf computer system is purchased, the customer may eventually need to have the system serviced, or may wish to modify and/or enhance the system. In that event, the customer must be sure that system compatible service and/or enhancements are provided. This can be accomplished by identifying the customer's system by model number.

More recently, customers have been purchasing custom created systems as opposed to an off-the-shelf system. This can complicate service and modification of the system. Customers would have to know specifically what the make-up of their custom-built system is, as would the service technician or the vendor of the original system. This can be checked by providing the vendor or service technician with identifying information for the computer, such as a serial or other identification number or the name of the company that purchased the computer, so that the original purchase order or specifications can be referenced to know and understand all the custom features of a particular system.

For example, a customer may call the vendor and request a new or additional part or a replacement part for a custom built system. The vendor will need to reference the original system in order to advise the customer and provide compatible equipment. This is accomplished by the vendor

requesting that the customer provide the serial number or other identification number so that the original system may be reviewed and compatible components can be provided. This requires that the customer know or be able to locate the serial number and that the vendor be able to locate sales records and specification data relating to the customer specific system.

After a customer purchases a computer system, he or she may also be able to access the vendor again on the worldwide web to inquire about service and or further modifications and enhancements available for the customer specific system. This scenario still requires some form of, or exercise in, identifying the original system to avoid substituting or adding parts or enhancements that are not compatible with the original system. An example of a web page 100 for providing such identifying information to the vendor via the worldwide web is shown Fig. 1. As shown in Fig. 1, using the web page 100 a customer enters either a system service tag or express service code in a field 102 and then selects a button 104 labeled "Submit" to submit the information to the vendor.

Therefore, what is needed is a means for automatically identifying build-to-order customers when they connect back to a vendor via the worldwide web. No known system combines the task of connecting to the vendor and automatically providing identifying information.

Summary

One embodiment, accordingly, provides browser software loaded on a customer's system during a factory pre-install process that includes the customer's identification number in a universal resource locator pre-installed on the system hard drive. To this end, a computer system includes browser software provided on a hard drive in a customer system. The HTML content that is pre-installed on the hard drive by a vendor includes

identifying information so that when the customer contacts the vendor via the worldwide web, the customer and system are automatically identified to the vendor.

A principal advantage of this embodiment is that when the customer contacts the vendor, the customer does not have to locate the system's serial number or other necessary identifying information and possibly enter the information incorrectly on a form on a web page. The automatic identification of the customer and system to the vendor enables the vendor to provide the customer with information regarding the customer's specific system or the business segment that the customer services.

Brief Description of the Drawings

Fig. 1 illustrates a web page of a vendor website for obtaining identifying information for a computer system.

Fig. 2 is a block diagram of an exemplary personal computer system.

Fig. 3 is a block diagram of an exemplary operation of a preferred embodiment.

Figs. 4-7 illustrate various exemplary web pages of a vendor website embodying features of a preferred embodiment.

Description of a Preferred Embodiment

Fig. 1 illustrates a web page of a vendor website for obtaining identifying information for a computer system, as described above.

Fig. 2 is a system block diagram of a computer system 210 embodying features of a preferred embodiment. The computer system 210 includes a central processing unit ("CPU") 212, I/O devices, such as a display, a keyboard, a mouse, and associated controllers, collectively designated by a reference numeral 214, a hard disk and drive 216 and other storage devices, such as a floppy disk and drive and memory devices, collectively designated

by a reference numeral 218, and various other subsystems, collectively designated by a reference numeral 220, all interconnected via one or more buses, shown collectively in Fig. 2 as a bus 222.

Fig. 3 illustrates a factory installation process embodying features of a preferred embodiment. During installation of factory-installed software during manufacture of a computer system, such as the computer system 210, it is known to install general HTML content with tokens ("general HTML content") 300 onto the system 210. In accordance with a preferred embodiment, the general HTML content 300 is provided to a token substitution program 302 along with system and order information 304 specific to the particular computer system being configured. The information 304 typically includes system-specific information, i.e., an indication of hardware and software installed on the system, as well as system- and customer-specific information. The token substitution program 306 combines the general HTML content 300 with the system/order information 304 to generate system-specific content 308.

In particular, the token substitution program 306 inserts certain identifying information, which in the illustrated embodiment includes a system service tag ("SNUM") and a company type identifier ("COMPANY") into a uniform resource locator ("URL") referred to as a "GET URL" provided within the general HTML content of the system 210. Specifically, assuming the system service tag is BGP1X and the company type identifier is 26, the token substitution program 306 takes:

http://mydell.us.dell.com/channel/start.asp?svctag=%SNUM%&company=%COMPANY%

and generates the system specific content 308:

http://mydell.us.dell.com/channel/start.asp?svctag=BGP1X&company=26

An installer program 310 installs the system specific content 308 as part of the "Favorites" and "HTML Content" databases 312, 314,

respectively, preinstalled on the hard drive 216 of the customer's system 210.

It will be recognized that the above-described installation procedures shown and described with reference to Fig. 3 will be performed whether the computer system 210 is an "off-the-shelf" or "build-to-order" system.

Operation of the preferred embodiment described above will now be illustrated and described with reference to Figs. 4-7.

Referring to Fig. 4, a web page 400 is displayed when a customer has taken the appropriate step(s), such as making a selection from a list of "Favorites", or "Bookmarks", used interchangeably, to access vendor service and support via the worldwide web. Selecting the phrase "TROUBLESHOOTING YOUR COMPUTER" 402 results in the display of a web page 500 illustrated in Fig. 5. Using the system specific content 308 stored on the hard drive 216, the system service tag field 502 and express service code field 504 are automatically respectively filled in with the system service tag (in this case BGP1X) of the system 210, as well as an express service code corresponding to the system service tag (in this case, 19254741). It should be noted that the preferred embodiment described herein enables presentation of the web page 100 (Fig. 1) to be bypassed, as the information normally entered by the customer using the web page 100 is automatically entered by the preferred embodiment herein described.

Fig. 6 illustrates a web page 600 used by a customer to subscribe to updates provided by the vendor in connection with the customer's particular system and/or user environment. Again, when this page 600 is accessed, the service tag of the customer's system is automatically entered in a field 602, which field is filled in automatically using the system specific content 308. An appropriate one of several "user environment" radio buttons 608a-608k is automatically filled in using the "company" designation of the system specific content 308. In the example illustrated in Fig. 6, the field

604 contains "BGP1X" and a radio button designated "K-12 Education" 608k, which corresponds to company type identifier 26, is automatically selected. The example shown in Fig. 6 illustrates again how the opportunity for a customer to make an error in entering identifying information, in this case, service tag and user environment, is eliminated by the automatic provision of this information to the vendor's website.

Fig. 7 illustrates yet another use of the preferred embodiment described herein for automatically providing identifying information for a computer; in this case, the information is provided for the benefit of a customer who has decided to contact the vendor via telephone, rather than the worldwide web. As shown in Fig. 7, a web page 700 provides information to a customer on contacting the vendor via telephone. In a first of a series of instructions, the customer is advised to be prepared to provide the vendor with the system service express code and/or service tag number, both of which are provided on the page 700 so that the customer does not need to locate that information on his or her system.

As a result, one embodiment provides a method of providing a computer system with a built-in automatic custom identifier for use in identifying the computer system to a vendor website. General HTML content with tokens for the computer system is provided to a token substitution program. System and order information specific to the computer system is provided to the token substitution program. The token substitution program combines the general HTML content with the system and order information to generate system-specific content. The system-specific content is installed on a hard drive of the computer system.

Another embodiment provides a computer system including a processor, a memory, and at least one storage. The computer system further includes system-specific content stored in the storage. The system-specific content includes a built-in automatic customer identifier for

identifying the computer system to a vendor website when the computer system is connected thereto.

As it can be seen, the principal advantages of these embodiments are that when the customer contacts the vendor, the customer does not have to locate the system's serial number or other necessary identifying information and possibly enter the information incorrectly on a form on a web page. The automatic identification of the customer and system to the vendor enables the vendor to provide the customer with information regarding the customer's specific system or the business segment that the customer services. The customer is not required to remember or locate the identifying information for his or her system, as that identifying information is automatically provided to the vendor without customer involvement. Because the customer is not required to type in the necessary identifying information, the risk that errors will be introduced into the information due to typographical errors is effectively eliminated. Also, the customer is not required to read and understand a written explanation of how to find and enter the necessary identifying information, thereby accelerating the process of providing such information to the vendor.

It will be recognized that the automatic provision of the identifying information accomplished by the embodiment described herein enables the vendor website automatically to display on a web page thereof information specific to the computer system 210, including, but not limited to, a list of hardware and software components available for repairing or upgrading the computer system and troubleshooting instructions for enabling the customer to determine, and potentially fix, a problem with the computer system.

Although an illustrative embodiment has been shown and described, other modifications, changes, and substitutions are intended in the foregoing disclosure. Accordingly, it is appropriate that the appended

claims be construed broadly and in a manner consistent with the scope of the disclosure.

This application is a divisional of SG 9902576-9.

CLAIMS:

1. A computer system comprising a processor, a memory device, and at least one storage device, the computer system further comprising system-specific content stored in said at least one storage device, wherein said system-specific content comprises a built-in automatic customer identifier for identifying the computer system to a vendor website when said computer system is connected thereto.

2. The computer system of claim 1 wherein said system-specific content comprises a GET URL.

3. The computer system of claim 1 wherein said system and order information comprises a system identifier for said computer system.

4. The computer system of claim 1 wherein said system-specific content is stored in a favorites database of said at least one storage device.

5. The computer system of claim 1 wherein said system-specific content is stored in a HTML content database of said at least one storage device.

6. The computer system of claim 3 wherein, upon connection of said computer system to said vendor website, said system identifier includes a service tag automatically inserted in at least one appropriate field of a page of said vendor website.

7. The computer system of claim 3 wherein, upon connection of said computer system to said vendor website, said customer type identifier is automatically provided to said vendor website for enabling selection of a customer environment to be made and displayed on a web page of said vendor website.

8. The computer system of claim 1 wherein, upon connection of said computer system to said vendor website, said system-specific content is automatically provided to said vendor website and enables said vendor website to display on a web page of said vendor website information specific to said computer system.

* C L M S *

9. The computer system of claim 8 wherein said information specific to said computer system is selected from the group consisting of a list of available hardware components, troubleshooting instructions, and a list of available software components.

10. The computer system of claim 1 wherein said at least one storage device is a hard drive.
