## (54) Title: DYNAMICALLY SPLITTING MULTI-TENANT DATABASES

Fig. 6

(57) **Abstract:** An online service includes managed databases that include one or more tenants (e.g. customers, users). A multi-tenant database may be split between two or more databases while the database being split continues processing requests. For example, web servers continue to request operations on the database while content is being moved. After moving the content, tenant traffic is automatically redirected to the database that contains the tenant's content.
