(54) Title: HAEMOSTATIC VALVE

(57) Abstract: A haemostatic valve according to an embodiment comprises a valve housing receiving an intravascular device, a first slider arranged on the valve housing moveable in a first direction, and a second slider received in the valve housing moveable in a second direction and elastically biased, the first slider being operatively connected to the second slider via a transmission mechanism so that movement of the first slider towards along the first direction causes the second slider to move away from an elastic valve member along the second direction, and the elastic valve member arranged between and compressible by the second slider, the elastic valve member receiving the intravascular device and compressing the intravascular device when being compressed by the second slider.
