RESOURCE TRANSMISSION METHOD AND APPARATUS

ABSTRACT

Implementations of the present application disclose a resource transmission method and apparatus. The method includes the following: receiving a resource sending request of a first user, where the resource sending request includes at least a resource to be sent, a user question matching the resource, and location information corresponding to the resource; and releasing the location information to verify a second user based on the user question when the second user obtains the resource through a search based on the released location information, and sending the resource to the second user after the verification succeeds. Based on the method, the following cumbersome process can be alleviated: A resource acquirer searches for a specific target object at a specified location and collects an image. As such, resources can be conveniently obtained.
