

ABSTRACT

COMMUNICATION METHOD AND APPARATUS

5 This application provides a communication method and an apparatus. The method includes: a mobility management network element first determines a terminal list, and then sends configuration information (including policy information and network information) to a terminal in the terminal list, so that the terminal performs updating based on the received configuration information, thereby updating configuration of the terminal. In addition, the
10 mobility management network element updates configuration information of only a terminal that is in a service area of a network and that has subscribed to a DNN of the network, so that network overheads can be reduced.
