

METHOD FOR DETERMINING EDGE CONFIGURATION SERVER AND APPARATUS

ABSTRACT

Embodiments of this application relate to the field of communication technologies, and
5 provide a method for determining an edge configuration server and an apparatus, to select a more
proper edge configuration server for a terminal apparatus. The method includes: A core network
element determines, based on a mobile network accessed by a terminal apparatus, that an edge
configuration server serving the terminal apparatus is a first edge configuration server, where at
least one mobile network corresponding to the first edge configuration server includes the mobile
10 network accessed by the terminal apparatus. The core network element sends, to the terminal
apparatus, information indicating the first edge configuration server.
