

ACCESS MANAGEMENT SYSTEM, COMMUNICATION SYSTEM, RECORDING
MEDIUM, AND ACCESS MANAGEMENT METHOD

ABSTRACT

An access management system (50) identifies, based on a model of a communication terminal serving as an origin of access to a resource, a function available in the
5 communication terminal serving as the access origin, and performs control such that function information indicating the identified function is transmitted to an application. This eliminates, when the communication terminal accesses the application, the need for the application side to
10 identify the function to be provided to the communication terminal, thereby making it possible to reduce the load of the application side.
