(54) Title: SYSTEM FOR SCALABLE PROCESSING OF FILES IN THE CLOUD

Fig. 1

(57) Abstract: The present invention relates to a system for transmission of files, which files are generated by a first user at a first client station, which first client station is connected by a first computer network such as a Local Area Network (LAN) to one or more local servers, which first server performs communication to a number of computer systems connected to the first LAN. It is the object of the invention to achieve worldwide net scalable files transferring processes without the need for transferring the files over the wide area net, but to retain the user's full access to any file. A further object of the invention is to prevent storage of large files at a plurality of servers during and after data transmission. The object can be fulfilled by a system or a method whereby the first server generate and transmit at least one meta data file related to file stored in the data cache by the Internet to at least one Master Server Unit (MSU), which MSU is part of a corporate or public data centre (CDC) to which CDC a number of second servers are communicating, which first user or a number of users can access the meta data file related to the file by any client station by any LAN connection to any of the second servers.
