FIG. 1

FIG. 2

FIG. 3A

The central training targets start their superotemporal movements from the central point of quadrant of the visual field of "matts"		
Left visual field	Right visual field	Divergent fusion of the two images via the brain visual center, aiming to obtain the binocular single
Visual target moving direction	Visual target moving direction	When the central training targets are at the central point, the binocular single vision state is obtained
		
		The binocular single vision state is obtained
		The binocular single vision state disappears with breakdown of the binocular single image
When the binocular single vision state disappears with breakdown of the binocular single image, the central training visual targets stop their superotemporal movements and start to move back to the central point of quadrant of visual field of "matts"		
Visual target moving direction	Visual target moving direction	Binocular overlap state
		
		The binocular single vision state is obtained
		The central training visual targets move back to central point to obtain the binocular single vision state

FIG. 3B

The central training targets start their inferotemporal movements from the central point of quadrant of the visual field of "matts"		
Left visual field	Right visual field	Divergent fusion of the two images via the brain visual center, aiming to obtain the binocular single vision
 Visual target moving direction	 Visual target moving direction	When the central training targets are at the central point, the binocular single vision state is obtained
		The binocular single vision state is obtained
		The binocular single vision state disappears with breakdown of the binocular single image 
When the binocular single vision state disappears with breakdown of the binocular single image, the central training visual targets stop their inferotemporal movements and start to move back to the central point of quadrant of visual field of "matts"		
 Visual target moving direction	 Visual target moving direction	Binocular overlap state
		The binocular single vision state is obtained
		The central training visual targets move back to central point to obtain the binocular single vision state
