(54) Title: REFERENCE PICTURE DERIVATION IN VIDEO CODING

(57) Abstract: Example methods, devices, and computer-readable media are described. An example device for decoding video data includes one or more processors configured to determine a current reference picture for a current block of a current picture of the video data based on a reference picture of a collocated block, a reference picture list of the current block, and a picture order count (POC) of a collocated picture. The collocated block is collocated with the current block and is in the collocated picture. The one or more processors are configured to decode the current block based on a motion vector associated with the current reference picture.
