

Abstract

Coating arrangement and method

In accordance with various embodiments, a coating arrangement may comprise: an electron beam gun for providing an electron beam; a beam trap for trapping the electron beam; a control device for driving the electron beam gun and/or the beam trap, wherein the control device is configured to switch over the driving between a plurality of configurations, of which: in a first configuration, the electron beam is directed onto the beam trap; and in a second configuration, the electron beam is directed past the beam trap.
