

LUMINOUS PANEL AND BUILDING WALL

ABSTRACT

This luminous panel (10) comprises at least two juxtaposed OLED devices (5) that form a front face of the luminous panel and define two light-emitting zones (S_5) separated by an intermediate zone (S_7). The panel (10) furthermore comprises luminous joint forming means that ensure, when the two OLED devices (5) are in the "on" state, visual continuity between the intermediate zone (S_7) and the two emitting zones (S_5), the luminous joint forming means being located at the back of or flush with the front face of the panel (10).
