### CROSS REFERENCE TO RELATED APPLICATIONS

**[0001]** This application claims priority to and the benefit of U.S. Provisional Patent Application Number 62/842,855 filed May 3, 2019, U.S. Provisional Patent Application Number 62/842,858 filed May 3, 2019, U.S. Provisional Patent Application Number 62/842,861 filed May 3, 2019, and U.S. Provisional Patent Application Number 62/982,858 filed February 28, 2020, the contents of each which are incorporated herein by reference in their entirety.

### BACKGROUND

**[0002]** KCNT1 encodes sodium-activated potassium channels known as Slack (Sequence like a calcium-activated  $K^+$  channel). These channels are found in neurons throughout the brain and can mediate a sodium-activated potassium current  $I_{KNa}$ . This delayed outward current can regulate neuronal excitability and the rate of adaption in response to maintained stimulation. Abnormal Slack activity have been associated with development of early onset epilepsies and intellectual impairment. Accordingly, pharmaceutical compounds that selectively regulate sodium-activated potassium channels, e.g., abnormal KCNT1, abnormal  $I_{KNa}$ , are useful in treating a neurological disease or disorder or a disease or condition related to excessive neuronal excitability and/or KCNT1 gain-of-function mutations.

### SUMMARY OF THE INVENTION

The chemical elements are identified in accordance with the Periodic Table of the Elements, CAS version, *Handbook of Chemistry and Physics*, 75<sup>th</sup> Ed., inside cover, and specific functional groups are generally defined as described therein.

Additionally, general principles of organic chemistry, as well as specific functional moieties and reactivity, are described in Thomas Sorrell, *Organic Chemistry*, University Science Books, Sausalito, 1999; Smith and March, *March's Advanced Organic Chemistry*, 5<sup>th</sup> Edition, John Wiley & Sons, Inc., New York, 2001; Larock, *Comprehensive Organic Transformations*, VCH Publishers, Inc., New York, 1989; and Carruthers, *Some Modern Methods of Organic Synthesis*, 3<sup>rd</sup> Edition, Cambridge University Press, Cambridge, 1987.

**[00038]** Compounds described herein can comprise one or more asymmetric centers, and thus can exist in various isomeric forms, e.g., enantiomers and/or diastereomers. For example, the compounds described herein can be in the form of an individual enantiomer, diastereomer or geometric isomer, or can be in the form of a mixture of stereoisomers, including racemic mixtures and mixtures enriched in one or more stereoisomer. Isomers can be isolated from mixtures by methods known to those skilled in the art, including chiral high pressure liquid chromatography (HPLC) and the formation and crystallization of chiral salts; or preferred isomers can be prepared by asymmetric syntheses. See, for example, Jacques *et al.*, *Enantiomers, Racemates and Resolutions* (Wiley Interscience, New York, 1981); Wilen *et al.*, *Tetrahedron* 33:2725 (1977); Eliel, *Stereochemistry of Carbon Compounds* (McGraw-Hill, NY, 1962); and Wilen, *Tables of Resolving Agents and Optical Resolutions* p. 268 (E.L. The term “enantiomerically pure” or “pure enantiomer” denotes that the compound comprises more than 75% by weight, more than 80% by weight, more than 85% by weight, more than 90% by weight, more than 91% by weight, more than 92% by weight, more than 93% by weight, more than 94% by weight, more than 95% by weight, more than 96% by weight, more than 97% by weight, more than 98% by weight, more than 98.5% by weight, more than 99% by weight, more than 99.2% by weight, more than 99.5% by weight, more than 99.6% by weight, more than 99.7% by weight, more than 99.8% by weight or more than 99.9% by weight, of the enantiomer. In certain embodiments, the weights are based upon total weight of all enantiomers or stereoisomers of the compound.

**[00040]** In the compositions provided herein, an enantiomerically pure compound can be present with other active or inactive ingredients. For example, a pharmaceutical composition comprising enantiomerically pure R-compound can comprise, for example, about 90% excipient and about 10% enantiomerically pure R-compound. In certain embodiments, the enantiomerically pure R-compound in such compositions can, for example, comprise, at least about 95% by weight R-compound and at most about 5% by weight S-compound, by total weight of the compound. For example, a pharmaceutical composition comprising enantiomerically pure S-compound can comprise, for example, about 90% excipient and about 10% enantiomerically pure S-compound. In certain embodiments, the enantiomerically pure S-compound in such compositions can, for example, comprise, at least about 95% by weight S-compound and at most about 5% by weight R-compound, by total weight of the compound. In certain embodiments, the active ingredient can be formulated with little or no excipient or carrier.

**[00041]** Compound described herein may also comprise one or more isotopic substitutions. For example, H may be in any isotopic form, including  $^1\text{H}$ ,  $^2\text{H}$  (D or deuterium), and  $^3\text{H}$  (T or tritium); C may be in any isotopic form, including  $^{12}\text{C}$ ,  $^{13}\text{C}$ , and  $^{14}\text{C}$ ; O may be in any isotopic form, including  $^{16}\text{O}$  and  $^{18}\text{O}$ ; F may be in any isotopic form, including  $^{18}\text{F}$  and  $^{19}\text{F}$ ; and the like.

### General Synthetic Schemes

**[000149]** Exemplary methods for preparing compounds described herein are illustrated in the following synthetic schemes. These schemes are given for the purpose of illustrating the invention, and should not be regarded in any manner as limiting the scope or the spirit of the invention.

**[000150]** The synthetic route illustrated in Scheme I-1 depicts an exemplary procedure for preparing carboxylic acid **I-C**. In the first step, **I-A** is carbonylated to form ester **I-B** under standard carbonylation reaction conditions (e.g., CO, Pd(dppf)Cl<sub>2</sub> and Et<sub>3</sub>N in ROH). Then, ester **I-B** is hydrolyzed to provide carboxylic acid **I-C**.

SCHEME I-1

[000151] The synthetic route illustrated in Scheme I-2 depicts an exemplary procedure for preparing **I-E** (a compound of Formula I-I). In this route, carboxylic acid **I-C** is coupled with aminoindane **I-D** under standard peptide coupling reaction conditions (e.g., HATU and base) to provide the **I-E** (a compound of Formula I-I).

SCHEME I-2

[000152] The synthetic route illustrated in Scheme 1 depicts an exemplary procedure for preparing carboxylic acid **C**. In the first step, **A** is carbonylated to form ester **B** under standard carbonylation reaction conditions (e.g., CO, Pd(dppf)Cl<sub>2</sub> and Et<sub>3</sub>N in ethanol). Then, ester **B** is hydrolyzed to provide carboxylic acid **C**.

SCHEME 1

[000153] The synthetic route illustrated in Scheme 2 depicts an exemplary procedure for preparing **E** (a compound of Formula I). In this route, carboxylic acid **C** is coupled with aminoindane **D** under standard peptide coupling reaction conditions (e.g., HATU and Et<sub>3</sub>N in acetonitrile) to provide the **E** (a compound of Formula I).

SCHEME 2

[000154] The synthetic route illustrated in Scheme II-1 depicts an exemplary procedure for preparing aminoindane **II-B**. In this route, indanone **II-A** is reacted with ammonium acetate and sodium cyanoborohydride to form aminoindane **II-B**.

SCHEME II-1

[000155] The synthetic route illustrated in Scheme II-2 depicts an exemplary procedure for preparing carboxylic acid **II-D**. In this route, ester **II-C** is hydrolyzed to provide carboxylic acid **II-D**.

SCHEME II-2

[000156] The synthetic route illustrated in Scheme II-3 depicts an exemplary procedure for preparing **II-E** (a compound of Formula II). In this route, carboxylic acid **II-D** is coupled with aminoindane **II-B** under standard peptide coupling reaction conditions (e.g., HOBt and EDCI in dichloromethane in the presence of  $\text{NEt}_3$ ) to provide **II-E** (a compound of Formula II).

SCHEME II-3

[000157] The synthetic route illustrated in Scheme III-1 depicts an exemplary procedure for preparing **III-C** (a compound of Formula III). In this route, carboxylic acid **III-A** is coupled with aminoindane **III-B** under standard peptide coupling reaction conditions (e.g., HOBt and EDCI in dichloromethane in the presence of DMAP) to provide **III-C** (a compound of Formula III).

### Methods of Treatment

[000158] The compounds and compositions described above and herein can be used to treat a neurological disease or disorder or a disease or condition associated with excessive neuronal excitability and/or a gain-of-function mutation in a gene (e.g., KCNT1). Exemplary diseases, disorders, or conditions include epilepsy and other encephalopathies (e.g., epilepsy of infancy with migrating focal seizures (MMFSI, EIMFS), autosomal dominant nocturnal frontal lobe epilepsy (ADNFLE), West syndrome, infantile spasms, epileptic encephalopathy, developmental and epileptic encephalopathy (DEE), early infantile epileptic encephalopathy (EIEE), generalized epilepsy, focal epilepsy, multifocal epilepsy, temporal lobe epilepsy, Ohtahara syndrome, early myoclonic encephalopathy and Lennox Gastaut syndrome, drug resistant epilepsy, seizures (e.g., frontal lobe seizures, generalized tonic clonic seizures, asymmetric tonic seizures, focal seizures), leukodystrophy, hypomyelinating leukodystrophy, leukoencephalopathy, and sudden unexpected death in epilepsy, cardiac dysfunctions (e.g., cardiac arrhythmia, Brugada syndrome, , myocardial infarction), pulmonary vasculopathy / hemorrhage, pain and related conditions (e.g. neuropathic pain, acute/chronic pain, migraine, etc), muscle disorders (e.g. myotonia, neuromyotonia, cramp muscle spasms, spasticity), itch and pruritis, movement disorders (e.g., ataxia and cerebellar ataxias), psychiatric disorders (e.g. major depression, anxiety, bipolar disorder, schizophrenia, attention-deficit hyperactivity disorder), neurodevelopmental disorder, learning disorders, intellectual disability, Fragile X, neuronal plasticity, and autism spectrum disorders.

**[000159]** In some embodiments, the neurological disease or disorder or the disease or condition associated with excessive neuronal excitability and/or a gain-of-function mutation in a gene (e.g., KCNT1) is selected from EIMFS, ADNFLE and West syndrome. In some embodiments, the neurological disease or disorder or the disease or condition associated with excessive neuronal excitability and/or a gain-of-function mutation in a gene (e.g., KCNT1) is selected from infantile spasms, epileptic encephalopathy, focal epilepsy, Ohtahara syndrome, developmental and epileptic encephalopathy and Lennox Gastaut syndrome. In some embodiments, the neurological disease or disorder or the disease or condition associated with excessive neuronal excitability and/or a gain-of-function mutation in a gene (e.g., KCNT1) is seizure. In some embodiments, the neurological disease or disorder or the disease or condition associated with excessive neuronal excitability and/or a gain-of-function mutation in a gene (e.g., KCNT1) is selected from cardiac arrhythmia, Brugada syndrome, and myocardial infarction.

**[000160]** In some embodiments, the neurological disease or disorder or the disease or condition associated with excessive neuronal excitability and/or a gain-of-function mutation in a gene (e.g., KCNT1) is selected from the group consisting of the learning disorders, Fragile X, intellectual function, neuronal plasticity, psychiatric disorders, and autism spectrum disorders.

**[000161]** Accordingly, the compounds and compositions thereof can be administered to a subject with a neurological disease or disorder or a disease or condition associated with excessive neuronal excitability and/or a gain-of-function mutation in a gene such as KCNT1 (e.g., EIMFS, ADNFLE, West syndrome, infantile spasms, epileptic encephalopathy, focal epilepsy, Ohtahara syndrome, developmental and epileptic encephalopathy, and Lennox Gastaut syndrome, seizures, cardiac arrhythmia, Brugada syndrome, and myocardial infarction).

**[000162]** EIMFS is a rare and debilitating genetic condition characterized by an early onset (before 6 months of age) of almost continuous heterogeneous focal seizures, where seizures appear to migrate from one brain region and hemisphere to another. Patients with EIMFS are generally intellectually impaired, non-verbal and non-ambulatory. While several genes have been implicated to date, the gene that is most commonly associated with EIMFS is KCNT1. Several de novo mutations in KCNT1 have been identified in patients with EIMFS, including V271F, G288S, R428Q, R474Q, R474H, R474C, I760M, A934T, P924L, G243S, H257D, A259D, R262Q, Q270E, L274I, F346L, C377S, R398Q, P409S, A477T, F502V, M516V, Q550del, K629E, K629N, I760F, E893K, M896K, R933G, R950Q,

These mutations are gain-of-function, missense mutations that are dominant (i.e. present on only one allele) and result in change in function of the encoded potassium channel that causes a marked increase in whole cell current when tested in *Xenopus* oocyte or mammalian expression systems (see e.g. Milligan et al. (2015) *Ann Neurol.* 75(4): 581-590; Barcia et al. (2012) *Nat Genet.* 44(11): 1255-1259; and Mikati et al. (2015) *Ann Neurol.* 78(6): 995-999).

**[000163]** ADNFLE has a later onset than EIMFS, generally in mid-childhood, and is generally a less severe condition. It is characterized by nocturnal frontal lobe seizures and can result in psychiatric, behavioural and cognitive disabilities in patients with the condition. While ADNFLE is associated with genes encoding several neuronal nicotinic acetylcholine receptor subunits, mutations in the *KCNT1* gene have been implicated in more severe cases of the disease (Heron et al. (2012) *Nat Genet.* 44: 1188-1190). Functional studies of the mutated *KCNT1* genes associated with ADNFLE indicated that the underlying mutations (M896I, R398Q, Y796H and R928C) were dominant, gain-of-function mutations (Milligan et al. (2015) *Ann Neurol.* 75(4): 581-590; Mikati et al. (2015) *Ann Neurol.* 78(6): 995-999).

**[000164]** West syndrome is a severe form of epilepsy composed of a triad of infantile spasms, an interictal electroencephalogram (EEG) pattern termed hypsarrhythmia, and mental retardation, although a diagnosis can be made one of these elements is missing. Mutations in *KCNT1*, including G652V and R474H, have been associated with West syndrome (Fukuoka et al. (2017) *Brain Dev* 39:80-83 and Ohba et al. (2015) *Epilepsia* 56:e121-e128). Treatment targeting the *KCNT1* channel suggests that these mutations are gain-of-function mutations (Fukuoka et al. (2017) *Brain Dev* 39:80-83).

**[000165]** In one aspect, the present invention features a method of treating treat a disease or condition associated with excessive neuronal excitability and/or a gain-of-function mutation in a gene such as *KCNT1* (for example, epilepsy and other encephalopathies (e.g.,

epilepsy of infancy with migrating focal seizures (MMFSI, EIMFS), autosomal dominant nocturnal frontal lobe epilepsy (ADNFLE), West syndrome, infantile spasms, epileptic encephalopathy, focal epilepsy, Ohtahara syndrome, developmental and epileptic encephalopathy (DEE), and Lennox Gastaut syndrome, seizures, leukodystrophy, leukoencephalopathy, intellectual disability, Multifocal Epilepsy, Generalized tonic clonic seizures, Drug resistant epilepsy, Temporal lobe epilepsy, cerebellar ataxia, Asymmetric Tonic Seizures) and cardiac dysfunctions (e.g., cardiac arrhythmia, Brugada syndrome, sudden unexpected death in epilepsy, myocardial infarction), pain and related conditions (e.g. neuropathic pain, acute/chronic pain, migraine, etc), muscle disorders (e.g. myotonia, neuromyotonia, cramp muscle spasms, spasticity), itch and pruritis, ataxia and cerebellar ataxias, psychiatric disorders (e.g. major depression, anxiety, bipolar disorder, schizophrenia), learning disorders, Fragile X, neuronal plasticity, and autism spectrum disorders) comprising administering to a subject in need thereof a compound disclosed herein (e.g., a compound of Formula (I-I) or (I), (e.g., (I-Ia), (I-Ia1), (I-Ib), (I-Ib1), (I-Ic), (I-Ic1), (I-Ia), (I-a1), (I-b), (I-b1), (I-c), (I-c1), (I-d), or (I-d1)), a compound of Formula (II), (e.g., (II-a), (II-a1), (II-a2), (II-b), (II-b1), (II-b2), (II-c), (II-c1), (II-c2)), or a compound of Formula (III), (e.g., (III-a), (III-a1), (III-a2), (III-b), (III-b1), (III-b2), (III-c), (III-c1), (III-c2)))) or a pharmaceutically acceptable salt thereof) or a pharmaceutical composition disclosed herein (e.g., a pharmaceutical composition comprising a compound disclosed herein (e.g., a compound of Formula (I-I) or (I), (e.g., (I-Ia), (I-Ia1), (I-Ib), (I-Ib1), (I-Ic), (I-Ic1), (I-Ia), (I-a1), (I-b), (I-b1), (I-c), (I-c1), (I-d), or (I-d1)), a compound of Formula (II), (e.g., (II-a), (II-a1), (II-a2), (II-b), (II-b1), (II-b2), (II-c), (II-c1), (II-c2)), or a compound of Formula (III), (e.g., (III-a), (III-a1), (III-a2), (III-b), (III-b1), (III-b2), (III-c), (III-c1), (III-c2)))) or a pharmaceutically acceptable salt thereof), and a pharmaceutically acceptable excipient).

**[000166]** In some examples, the subject presenting with a disease or condition that may be associated with a gain-of-function mutation in KCNT1 is genotyped to confirm the presence of a known gain-of-function mutation in KCNT1 prior to administration of the compounds and compositions thereof. For example, whole exome sequencing can be performed on the subject. Gain-of-function mutations associated with EIMFS may include, but are not limited to, V271F, G288S, R428Q, R474Q, R474H, R474C, I760M, A934T, P924L, G243S, H257D, A259D, R262Q, Q270E, L274I, F346L, C377S, R398Q, P409S, A477T, F502V, M516V, Q550del, K629E, K629N, I760F, E893K, M896K, R933G, R950Q, and K1154Q. Gain-of-function mutations associated with ADNFLE may include, but are not limited to, M896I, R398Q, Y796H, R928C, and G288S. Gain-of-function mutations

associated with West syndrome may include, but are not limited to, G652V and R474H. Gain-of-function mutations associated with temporal lobe epilepsy may include, but are not limited to, R133H and R565H. Gain-of-function mutations associated with Lennox-Gastaut may include, but are not limited to, R209C. Gain-of-function mutations associated with seizures may include, but are not limited to, A259D, G288S, R474C, R474H. Gain-of-function mutations associated with leukodystrophy may include, but are not limited to, G288S and Q906H. Gain-of-function mutations associated with Multifocal Epilepsy may include, but are not limited to, V340M. Gain-of-function mutations associated with EOE may include, but are not limited to, F346L and A934T. Gain-of-function mutations associated with Early-onset epileptic encephalopathies (EOEE) may include, but are not limited to, R428Q. Gain-of-function mutations associated with developmental and epileptic encephalopathies may include, but are not limited to, F346L, R474H, and A934T. Gain-of-function mutations associated with epileptic encephalopathies may include, but are not limited to, L437F, Y796H, P924L, R961H. Gain-of-function mutations associated with Early Infantile Epileptic Encephalopathy (EIEE) may include, but are not limited to, M896K. Gain-of-function mutations associated with drug resistant epilepsy and generalized tonic-clonic seizure may include, but are not limited to, F346L. Gain-of-function mutations associated with migrating partial seizures of infancy may include, but are not limited to, R428Q. Gain-of-function mutations associated with Leukoencephalopathy may include, but are not limited to, F932I. Gain-of-function mutations associated with NFLE may include, but are not limited to, A934T and R950Q. Gain-of-function mutations associated with Brugada Syndrome may include, but are not limited to, R1106Q. Gain-of-function mutations associated with Brugada Syndrome may include, but are not limited to, R474H.

**[000167]** In other examples, the subject is first genotyped to identify the presence of a mutation in KCNT1 and this mutation is then confirmed to be a gain-of-function mutation using standard in vitro assays, such as those described in Milligan et al. (2015) *Ann Neurol.* 75(4): 581-590. Typically, the presence of a gain-of-function mutation is confirmed when the expression of the mutated KCNT1 allele results an increase in whole cell current compared to the whole cell current resulting from expression of wild-type KCNT1 as assessed using whole-cell electrophysiology (such as described in Milligan et al. (2015) *Ann Neurol.* 75(4): 581-590; Barcia et al. (2012) *Nat Genet.* 44(11): 1255-1259; Mikati et al.

(2015) Ann Neurol. 78(6): 995-999; or Rizzo et al. Mol Cell Neurosci. (2016) 72:54-63).

This increase of whole cell current can be, for example, an increase of at least or about 50%, 100%, 150%, 200%, 250%, 300%, 350%, 400% or more. The subject can then be confirmed to have a disease or condition associated with a gain-of-function mutation in KCNT1.

**[000168]** In particular examples, the subject is confirmed as having a KCNT1 allele containing a gain-of-function mutation (e.g. V271F, G288S, R398Q, R428Q, R474Q, R474H, R474C, G652V, I760M, Y796H, M896I, P924L, R928C or A934T).

**[000169]** The compounds disclosed herein (e.g., a compound of Formula (I-I) or (I), (e.g., (I-Ia), (I-Ia1), (I-Ib), (I-Ib1), (I-Ic), (I-Ic1), (I-a), (I-a1), (I-b), (I-b1), (I-c), (I-c1), (I-d), or (I-d1)), a compound of Formula (II), (e.g., (II-a), (II-a1), (II-a2), (II-b), (II-b1), (II-b2), (II-c), (II-c1), (II-c2)), or a compound of Formula (III), (e.g., (III-a), (III-a1), (III-a2), (III-b), (III-b1), (III-b2), (III-c), (III-c1), (III-c2)))) or a pharmaceutically acceptable salt thereof) or the pharmaceutical composition disclosed herein (e.g., a pharmaceutical composition comprising a compound disclosed herein (e.g., a compound of Formula (I-I) or (I), (e.g., (I-Ia), (I-Ia1), (I-Ib), (I-Ib1), (I-Ic), (I-Ic1), (I-a), (I-a1), (I-b), (I-b1), (I-c), (I-c1), (I-d), or (I-d1)), a compound of Formula (II), (e.g., (II-a), (II-a1), (II-a2), (II-b), (II-b1), (II-b2), (II-c), (II-c1), (II-c2)), or a compound of Formula (III), (e.g., (III-a), (III-a1), (III-a2), (III-b), (III-b1), (III-b2), (III-c), (III-c1), (III-c2)))) or a pharmaceutically acceptable salt thereof), and a pharmaceutically acceptable excipient) can also be used therapeutically for conditions associated with excessive neuronal excitability where the excessive neuronal excitability is not necessarily the result of a gain-of-function mutation in KCNT1. Even in instances where the disease is not the result of increased KCNT1 expression and/or activity, inhibition of KCNT1 expression and/or activity can nonetheless result in a reduction in neuronal excitability, thereby providing a therapeutic effect. Thus, the compounds disclosed herein (e.g., a compound of Formula (I-I) or (I), (e.g., (I-Ia), (I-Ia1), (I-Ib), (I-Ib1), (I-Ic), (I-Ic1), (I-a), (I-a1), (I-b), (I-b1), (I-c), (I-c1), (I-d), or (I-d1)), a compound of Formula (II), (e.g., (II-a), (II-a1), (II-a2), (II-b), (II-b1), (II-b2), (II-c), (II-c1), (II-c2)), or a compound of Formula (III), (e.g., (III-a), (III-a1), (III-a2), (III-b), (III-b1), (III-b2), (III-c), (III-c1), (III-c2)))) or a pharmaceutically acceptable salt thereof) or the pharmaceutical composition disclosed herein (e.g., a pharmaceutical composition comprising a compound disclosed herein (e.g., a compound of Formula (I-I) or (I), (e.g., (I-Ia), (I-Ia1), (I-Ib), (I-Ib1), (I-Ic), (I-Ic1), (I-a), (I-a1), (I-b), (I-b1), (I-c), (I-c1), (I-d), or (I-d1)), a compound of Formula (II), (e.g., (II-a), (II-a1), (II-a2), (II-b), (II-b1), (II-b2), (II-c), (II-c1), (II-c2)), or a compound of Formula (III), (e.g., (III-a), (III-a1), (III-a2), (III-b), (III-b1), (III-b2), (III-c), (III-c1), (III-c2)))) or a

pharmaceutically acceptable salt thereof), and a pharmaceutically acceptable excipient) can be used to treat a subject with conditions associated with excessive neuronal excitability, for example, epilepsy and other encephalopathies (e.g., epilepsy of infancy with migrating focal seizures (EIMFS), autosomal dominant nocturnal frontal lobe epilepsy (ADNFLE), West syndrome, infantile spasms, epileptic encephalopathy, focal epilepsy, Ohtahara syndrome, developmental and epileptic encephalopathy, and Lennox Gastaut syndrome, seizures) or cardiac dysfunctions (e.g., cardiac arrhythmia, Brugada syndrome, myocardial infarction), regardless of whether or not the disease or disorder is associated with a gain-of-function mutation in KCNT1.

### **Pharmaceutical Compositions and Routes of Administration**

**[000170]** Compounds provided in accordance with the present invention are usually administered in the form of pharmaceutical compositions. This invention therefore provides pharmaceutical compositions that contain, as the active ingredient, one or more of the compounds described, or a pharmaceutically acceptable salt or ester thereof, and one or more pharmaceutically acceptable excipients, carriers, including inert solid diluents and fillers, diluents, including sterile aqueous solution and various organic solvents, permeation enhancers, solubilizers and adjuvants. The pharmaceutical compositions may be administered alone or in combination with other therapeutic agents. Such compositions are prepared in a manner well known in the pharmaceutical art (see, e.g., Remington's Pharmaceutical Sciences, Mace Publishing Co., Philadelphia, Pa. 17th Ed. (1985); and Modern Pharmaceutics, Marcel Dekker, Inc. 3rd Ed. (G. S. Banker & C. T. Rhodes, Eds.)

**[000171]** The pharmaceutical compositions may be administered in either single or multiple doses by any of the accepted modes of administration of agents having similar utilities, for example as described in those patents and patent applications incorporated by reference, including rectal, buccal, intranasal and transdermal routes, by intra-arterial injection, intravenously, intraperitoneally, parenterally, intramuscularly, subcutaneously, orally, topically, as an inhalant, or via an impregnated or coated device such as a stent, for example, or an artery-inserted cylindrical polymer.

**[000172]** One mode for administration is parenteral, particularly by injection. The forms in which the novel compositions of the present invention may be incorporated for administration by injection include aqueous or oil suspensions, or emulsions, with sesame oil, corn oil, cottonseed oil, or peanut oil, as well as elixirs, mannitol, dextrose, or a sterile aqueous solution, and similar pharmaceutical vehicles. Aqueous solutions in saline are also

conventionally used for injection, but less preferred in the context of the present invention. Ethanol, glycerol, propylene glycol, liquid polyethylene glycol, and the like (and suitable mixtures thereof), cyclodextrin derivatives, and vegetable oils may also be employed. The proper fluidity can be maintained, for example, by the use of a coating, such as lecithin, by the maintenance of the required particle size in the case of dispersion and by the use of surfactants. The prevention of the action of microorganisms can be brought about by various antibacterial and antifungal agents, for example, parabens, chlorobutanol, phenol, sorbic acid, thimerosal, and the like.

**[000173]** Sterile injectable solutions are prepared by incorporating a compound according to the present invention in the required amount in the appropriate solvent with various other ingredients as enumerated above, as required, followed by filtered sterilization. Generally, dispersions are prepared by incorporating the various sterilized active ingredients into a sterile vehicle which contains the basic dispersion medium and the required other ingredients from those enumerated above. In the case of sterile powders for the preparation of sterile injectable solutions, the preferred methods of preparation are vacuum-drying and freeze-drying techniques which yield a powder of the active ingredient plus any additional desired ingredient from a previously sterile-filtered solution thereof.

**[000174]** Oral administration is another route for administration of compounds in accordance with the invention. Administration may be via capsule or enteric coated tablets, or the like. In making the pharmaceutical compositions that include at least one compound described herein, the active ingredient is usually diluted by an excipient and/or enclosed within such a carrier that can be in the form of a capsule, sachet, paper or other container. When the excipient serves as a diluent, it can be in the form of a solid, semi-solid, or liquid material (as above), which acts as a vehicle, carrier or medium for the active ingredient. Thus, the compositions can be in the form of tablets, pills, powders, lozenges, sachets, cachets, elixirs, suspensions, emulsions, solutions, syrups, aerosols (as a solid or in a liquid medium), ointments containing, for example, up to 10% by weight of the active compound, soft and hard gelatin capsules, sterile injectable solutions, and sterile packaged powders.

**[000175]** Some examples of suitable excipients include lactose, dextrose, sucrose, sorbitol, mannitol, starches, gum acacia, calcium phosphate, alginates, tragacanth, gelatin, calcium silicate, microcrystalline cellulose, polyvinylpyrrolidone, cellulose, sterile water, syrup, and methyl cellulose. The formulations can additionally include: lubricating agents such as talc, magnesium stearate, and mineral oil; wetting agents; emulsifying and

suspending agents; preserving agents such as methyl and propylhydroxy-benzoates; sweetening agents; and flavoring agents.

**[000176]** The compositions of the invention can be formulated so as to provide quick, sustained or delayed release of the active ingredient after administration to the patient by employing procedures known in the art. Controlled release drug delivery systems for oral administration include osmotic pump systems and dissolutional systems containing polymer-coated reservoirs or drug-polymer matrix formulations. Examples of controlled release systems are given in U.S. Pat. Nos. 3,845,770; 4,326,525; 4,902,514; and 5,616,345. Another formulation for use in the methods of the present invention employs transdermal delivery devices ("patches"). Such transdermal patches may be used to provide continuous or discontinuous infusion of the compounds of the present invention in controlled amounts. The construction and use of transdermal patches for the delivery of pharmaceutical agents is well known in the art. See, e.g., U.S. Pat. Nos. 5,023,252, 4,992,445 and 5,001,139. Such patches may be constructed for continuous, pulsatile, or on demand delivery of pharmaceutical agents.

**[000177]** The compositions are preferably formulated in a unit dosage form. The term "unit dosage forms" refers to physically discrete units suitable as unitary dosages for human subjects and other mammals, each unit containing a predetermined quantity of active material calculated to produce the desired therapeutic effect, in association with a suitable pharmaceutical excipient (e.g., a tablet, capsule, ampoule). The compounds are generally administered in a pharmaceutically effective amount. Preferably, for oral administration, each dosage unit contains from 1 mg to 2 g of a compound described herein, and for parenteral administration, preferably from 0.1 to 700 mg of a compound a compound described herein. It will be understood, however, that the amount of the compound actually administered usually will be determined by a physician, in the light of the relevant circumstances, including the condition to be treated, the chosen route of administration, the actual compound administered and its relative activity, the age, weight, and response of the individual patient, the severity of the patient's symptoms, and the like.

**[000178]** For preparing solid compositions such as tablets, the principal active ingredient is mixed with a pharmaceutical excipient to form a solid preformulation composition containing a homogeneous mixture of a compound of the present invention. When referring to these preformulation compositions as homogeneous, it is meant that the active ingredient is dispersed evenly throughout the composition so that the composition may

be readily subdivided into equally effective unit dosage forms such as tablets, pills and capsules.

**[000179]** The tablets or pills of the present invention may be coated or otherwise compounded to provide a dosage form affording the advantage of prolonged action, or to protect from the acid conditions of the stomach. For example, the tablet or pill can comprise an inner dosage and an outer dosage component, the latter being in the form of an envelope over the former. The two components can be separated by an enteric layer that serves to resist disintegration in the stomach and permit the inner component to pass intact into the duodenum or to be delayed in release. A variety of materials can be used for such enteric layers or coatings, such materials including a number of polymeric acids and mixtures of polymeric acids with such materials as shellac, cetyl alcohol, and cellulose acetate.

**[000180]** Compositions for inhalation or insufflation include solutions and suspensions in pharmaceutically acceptable, aqueous or organic solvents, or mixtures thereof, and powders. The liquid or solid compositions may contain suitable pharmaceutically acceptable excipients as described supra. Preferably, the compositions are administered by the oral or nasal respiratory route for local or systemic effect. Compositions in preferably pharmaceutically acceptable solvents may be nebulized by use of inert gases. Nebulized solutions may be inhaled directly from the nebulizing device or the nebulizing device may be attached to a facemask tent, or intermittent positive pressure breathing machine. Solution, suspension, or powder compositions may be administered, preferably orally or nasally, from devices that deliver the formulation in an appropriate manner.

**[000181]** In some embodiments, a pharmaceutical composition comprising a disclosed compound, or pharmaceutically acceptable salt thereof, and a pharmaceutically acceptable carrier.

### EXAMPLES

**[000182]** In order that the invention described herein may be more fully understood, the following examples are set forth. The synthetic and biological examples described in this application are offered to illustrate the compounds, pharmaceutical compositions and methods provided herein and are not to be construed in any way as limiting their scope.

**[000183]** The compounds provided herein can be prepared from readily available starting materials using the following general methods and procedures. It will be appreciated that where typical or preferred process conditions (i.e., reaction temperatures, times, mole ratios of reactants, solvents, pressures, etc.) are given, other process conditions can also be

used unless otherwise stated. Optimal reaction conditions may vary with the particular reactants or solvent used, but such conditions can be determined by one skilled in the art by routine optimization.

**[000184]** Additionally, as will be apparent to those skilled in the art, conventional protecting groups may be necessary to prevent certain functional groups from undergoing undesired reactions. The choice of a suitable protecting group for a particular functional group as well as suitable conditions for protection and deprotection are well known in the art. For example, numerous protecting groups, and their introduction and removal, are described in T. W. Greene and P. G. M. Wuts, *Protecting Groups in Organic Synthesis*, Second Edition, Wiley, New York, 1991, and references cited therein.

**[000185]** The compounds provided herein may be isolated and purified by known standard procedures. Such procedures include recrystallization, filtration, flash chromatography, trituration, high pressure liquid chromatography (HPLC), or supercritical fluid chromatography (SFC). Note that flash chromatography may either be performed manually or via an automated system. The compounds provided herein may be characterized by known standard procedures, such as nuclear magnetic resonance spectroscopy (NMR) or liquid chromatography mass spectrometry (LCMS). NMR chemical shifts are reported in part per million (ppm) and are generated using methods well known to those of skill in the art.

**Example 110. Efficacy of exemplary compounds in the inhibition of KCNT1****KCNT1-WT-Basal - Patch Clamp Assay**

**[000400]** Inhibition of KCNT1 (KNa1.1, Slack) was evaluated using a tetracycline inducible cell line (HEK-TREX). Currents were recorded using the SyncroPatch 384PE automated, patch clamp system. Pulse generation and data collection were performed with PatchController384 V1.3.0 and DataController384 V1.2.1 (Nanion Technologies). The access resistance and apparent membrane capacitance were estimated using built-in protocols. Current were recorded in perforated patch mode (10  $\mu$ M escin) from a population of cells. The cells were lifted, triturated, and resuspended at 800,000 cells/ml. The cells were allowed to recover in the cell hotel prior to experimentation. Currents were recorded at room temperature. The external solution contained the following (in mM): NaCl 105, NMDG 40, KCl 4, MgCl<sub>2</sub> 1, CaCl<sub>2</sub> 5 and HEPES 10 (pH = 7.4, Osmolarity ~300 mOsm). The extracellular solution was used as the wash, reference and compound delivery solution. The internal solution contained the following (in mM): NaCl 70, KF 70, KCl 10, EGTA 5, HEPES 5 and Escin 0.01 (pH = 7.2, Osmolarity ~295 mOsm). Escin is made at a 5mM stock in water, aliquoted, and stored at -20°C. The compound plate was created at 2x concentrated in the extracellular solution. The compound was diluted to 1:2 when added to the recording well. The amount of DMSO in the extracellular solution was held constant at the level used for the highest tested concentration. A holding potential of -80 mV with a 100ms step to 0mV was used. Mean current was measured during the step to 0 mV. 100  $\mu$ M Bepidil was used to completely inhibit KCNT1 current to allow for offline subtraction of non-KCNT1 current. The average mean current from 3 sweeps was calculated and the % inhibition of each compound was calculated. The % Inhibition as a function of the compound concentration was fit with a Hill equation to derive IC<sub>50</sub>, slope, min and max parameters. If KCNT1 inhibition was less than 50% at the highest tested concentration or if an IC<sub>50</sub> could not be calculated, then a percent inhibition was reported in place of the IC<sub>50</sub>.

**[000401]** Results from this assay are summarized in Table 1 below. In this table, “A” indicates IC<sub>50</sub> of less than or equal to 1  $\mu$ M; “B” indicates inhibition of between 1  $\mu$ M to 20  $\mu$ M; and “C” indicates inhibition of greater than or equal to 20  $\mu$ M.
