

ABSTRACT

Disclosed in the embodiments of the present application are an electronic locker control method, system and apparatus, a storage medium, an electronic device and a program product. The method comprises: receiving a first biometric characteristic of a first target object that is sent by a first server, and storing in a biometric characteristic database the first biometric characteristic of the first target object; in response to a pickup operation performed by the first target object on an electronic locker, calling a biometric characteristic acquisition device to acquire a second biometric characteristic of the first target object, and matching the second biometric characteristic of the first target object with each first biometric characteristic in the biometric characteristic database; if a first biometric characteristic matching the second biometric characteristic is present in the biometric characteristic database, performing identity authentication on the first target object, and sending a pickup payment request to the first server; and when a payment success response returned by the first server has been received, sending a first opening instruction to a target electronic storage compartment of the electronic locker that corresponds to a first target order, so as to control a locker door of the target electronic storage compartment to open.
