

**ELECTRONIC APPARATUS FOR MANAGING LOGISTICS INFORMATION
AND CONTROL METHOD THEREOF**

ABSTRACT

5 According to various embodiments, a logistics information managing method
may include identifying at least one of information on a source fulfillment center and
information on a target fulfillment center, identifying transfer target candidate order
information among order information allocated to the source fulfillment center, and
allocating at least a portion of the transfer target candidate order information to the target
10 fulfillment center. Through this, order information previously allocated to a fulfillment
center may be reallocated to another fulfillment center, thereby preventing a non-
compliance with order processing. Other embodiments are possible as well.
