BACKGROUND OF THE INVENTION

[0004] Hemostasis, the control of bleeding, occurs by surgical means, or by the
physiological properties of vasoconstriction and coagulation. This invention is particularly
concerned with blood coagulation and ways in which it assists in maintaining the integrity of
20 mammalian circulation after injury, inflammation, disease, congenital defect, dysfunction or
other disruption. Although platelets and blood coagulation are both involved in thrombus
formation, certain components of the coagulation cascade are primarily responsible for the
amplification or acceleration of the processes involved in platelet aggregation and fibrin
deposition.

25 [0005] Thrombin is a key enzyme in the coagulation cascade as well as in hemostasis.
Thrombin plays a central role in thrombosis through its ability to catalyze the conversion of
fibrinogen into fibrin and through its potent platelet activation activity. Direct or indirect
inhibition of thrombin activity has been the focus of a variety of recent anticoagulant
strategies as reviewed by Claeson, G., "Synthetic Peptides and Peptidomimetics as Substrates
30 and Inhibitors of Thrombin and Other Proteases in the Blood Coagulation System", *Blood
Coag. Fibrinol.*, 5:411-436 (1994). Several classes of anticoagulants currently used in the

clinic directly or indirectly affect thrombin (i.e. heparins, low-molecular weight heparins, heparin-like compounds and coumarins).

- [0006] A prothrombinase complex, including Factor Xa (a serine protease, the activated form of its Factor X precursor and a member of the calcium ion binding, gamma carboxyglutamyl (Gla)-containing, vitamin K dependent, blood coagulation glycoprotein family), converts the zymogen prothrombin into the active procoagulant thrombin. Unlike thrombin, which acts on a variety of protein substrates as well as at a specific receptor, factor Xa appears to have a single physiologic substrate, namely prothrombin. Since one molecule of factor Xa may be able to generate up to 138 molecules of thrombin (Elodi *et al.*, *Thromb. Res.* 15:617-619 (1979)), direct inhibition of factor Xa as a way of indirectly inhibiting the formation of thrombin may be an efficient anticoagulant strategy. Therefore, it has been suggested that compounds which selectively inhibit factor Xa may be useful as *in vitro* diagnostic agents, or for therapeutic administration in certain thrombotic disorders, *see e.g.*, WO 94/13693.
- [0007] Polypeptides derived from hematophagous organisms have been reported which are highly potent and specific inhibitors of factor Xa. U.S. Patent No. 4,588,587 describes anticoagulant activity in the saliva of the Mexican leech, *Haementeria officinalis*. A principal component of this saliva was shown to be the polypeptide factor Xa inhibitor, antistasin (ATS), by Nutt, E. *et al.*, "The Amino Acid Sequence of Antistasin, a Potent Inhibitor of Factor Xa Reveals a Repeated Internal Structure", *J. Biol. Chem.*, 263:10162-10167 (1988). Another potent and highly specific inhibitor of Factor Xa, called tick anticoagulant peptide (TAP), has been isolated from the whole body extract of the soft tick *Ornithodoros moubata*, as reported by Waxman, L., *et al.*, "Tick Anticoagulant Peptide (TAP) is a Novel Inhibitor of Blood Coagulation Factor Xa", *Science*, 248:593-596 (1990).
- [0008] Factor Xa inhibitory compounds which are not large polypeptide-type inhibitors have also been reported (*see e.g.* Tidwell, R.R. *et al.*, "Strategies for Anticoagulation With Synthetic Protease Inhibitors. Xa Inhibitors Versus Thrombin Inhibitors", *Thromb. Res.*, 19:339-349 (1980); Turner, A.D. *et al.*, "p-Amidino Esters as Irreversible Inhibitors of Factor IXa and Xa and Thrombin", *Biochemistry*, 25:4929-4935 (1986); Hitomi, Y. *et al.*, "Inhibitory Effect of New Synthetic Protease Inhibitor (FUT-175) on the Coagulation System", *Haemostasis*, 15:164-168 (1985); Sturzebecher, J. *et al.*, "Synthetic Inhibitors of Bovine Factor Xa and Thrombin. Comparison of Their Anticoagulant Efficiency", *Thromb.*

Res., 54:245-252 (1989); Kam, C.M. *et al.*, "Mechanism Based Isocoumarin Inhibitors for Trypsin and Blood Coagulation Serine Proteases: New Anticoagulants", *Biochemistry*, 27:2547-2557 (1988); Hauptmann, J. *et al.*, "Comparison of the Anticoagulant and Antithrombotic Effects of Synthetic Thrombin and Factor Xa Inhibitors", *Thromb. Haemost.*, 5 63:220-223 (1990)).

[0009] Others have reported Factor Xa inhibitors which are small molecule organic compounds, such as nitrogen containing heterocyclic compounds which have amidino substituent groups, wherein two functional groups of the compounds can bind to Factor Xa at two of its active sites. For example, WO 98/28269 describes pyrazole compounds having a 10 terminal C(=NH)-NH₂ group; WO 97/21437 describes benzimidazole compounds substituted by a basic radical which are connected to a naphthyl group via a straight or branched chain alkylene, C(=O) or S(=O)₂ bridging group; WO 99/10316 describes compounds having a 4-phenyl-N-alkylamidino-piperidine and 4-phenoxy-N-alkylamidino-piperidine group connected to a 3-amidinophenyl group via a carboxamidealkyleneamino bridge; and EP 15 798295 describes compounds having a 4-phenoxy-N-alkylamidino-piperidine group connected to an amidinonaphthyl group via a substituted or unsubstituted sulfonamide or carboxamide bridging group.

[0010] There exists a need for effective therapeutic agents for the regulation of hemostasis, and for the prevention and treatment of thrombus formation and other pathological processes in the vasculature induced by thrombin such as restenosis and inflammation. In particular, 20 there continues to be a need for compounds which selectively inhibit factor Xa or its precursors. Compounds that have different combinations of bridging groups and functional groups than compounds previously discovered are needed, particularly compounds which selectively or preferentially bind to Factor Xa. Compounds with a higher degree of binding 25 to Factor Xa than to thrombin are desired, especially those compounds having good bioavailability and/or solubility.

DETAILED DESCRIPTION OF THE INVENTION

15 Abbreviations and Definitions

[0019] The term "alkyl", by itself or as part of another substituent, means, unless otherwise stated, a straight or branched chain hydrocarbon radical, having the number of carbon atoms designated (*i.e.* C₁₋₈ means one to eight carbons). Examples of alkyl groups include methyl, ethyl, n-propyl, isopropyl, n-butyl, t-butyl, isobutyl, sec-butyl, n-pentyl, n-hexyl, n-heptyl, n-octyl, and the like. The term "alkenyl" refers to an unsaturated alkyl group is one having one or more double bonds. Similarly, the term "alkynyl" refers to an unsaturated alkyl group having one or more triple bonds. Examples of such unsaturated alkyl groups include vinyl, 2-propenyl, crotyl, 2-isopentenyl, 2-(butadienyl), 2,4-pentadienyl, 3-(1,4-pentadienyl), ethynyl, 1- and 3-propynyl, 3-butylnyl, and the higher homologs and isomers. The term "cycloalkyl" refers to hydrocarbon rings having the indicated number of ring atoms (e.g., C₃₋₆cycloalkyl) and being fully saturated or having no more than one double bond between ring vertices. When "cycloalkyl" is used in combination with "alkyl", as in C₃₋₅cycloalkyl-alkyl, the cycloalkyl portion is meant to have from three to five carbon atoms, while the alkyl portion is an alkylene moiety having from one to three carbon atoms (e.g., -CH₂-, -CH₂CH₂- or -CH₂CH₂CH₂-).

30

[0020] The term "alkylene" by itself or as part of another substituent means a divalent radical derived from an alkane, as exemplified by -CH₂CH₂CH₂CH₂-. Typically, an alkyl (or

alkylene) group will have from 1 to 24 carbon atoms, with those groups having 10 or fewer carbon atoms being preferred in the present invention. A "lower alkyl" or "lower alkylene" is a shorter chain alkyl or alkylene group, generally having four or fewer carbon atoms.

[0021] The terms "alkoxy," "alkylamino" and "alkylthio" (or thioalkoxy) are used in their conventional sense, and refer to those alkyl groups attached to the remainder of the molecule via an oxygen atom, an amino group, or a sulfur atom, respectively. Additionally, for dialkylamino groups (typically provided as $-NR^aR^b$ or a variant thereof), the alkyl portions can be the same or different and can also be combined to form a 3-7 membered ring with the nitrogen atom to which each is attached. Accordingly, a group represented as $-NR^aR^b$ is meant to include piperidinyl, pyrrolidinyl, morpholinyl, azetidiny and the like.

[0022] The terms "halo" or "halogen," by themselves or as part of another substituent, mean, unless otherwise stated, a fluorine, chlorine, bromine, or iodine atom. Additionally, terms such as "haloalkyl," are meant to include monohaloalkyl and polyhaloalkyl. For example, the term " C_{1-4} haloalkyl" is mean to include trifluoromethyl, 2,2,2-trifluoroethyl, 4-chlorobutyl, 3-bromopropyl, and the like.

[0023] The term "aryl" means, unless otherwise stated, a polyunsaturated, typically aromatic, hydrocarbon group which can be a single ring or multiple rings (up to three rings) which are fused together or linked covalently. The term "heteroaryl" refers to aryl groups (or rings) that contain from one to five heteroatoms selected from N, O, and S, wherein the nitrogen and sulfur atoms are optionally oxidized, and the nitrogen atom(s) are optionally quaternized. A heteroaryl group can be attached to the remainder of the molecule through a heteroatom or through a carbon atom. Non-limiting examples of aryl groups include phenyl, naphthyl and biphenyl, while non-limiting examples of heteroaryl groups include 1-pyrrolyl, 2-pyrrolyl, 3-pyrrolyl, 1-pyrazolyl, 3-pyrazolyl, 2-imidazolyl, 4-imidazolyl, pyrazinyl, 2-oxazolyl, 4-oxazolyl, 5-oxazolyl, 3-isoxazolyl, 4-isoxazolyl, 5-isoxazolyl, 2-thiazolyl, 4-thiazolyl, 5-thiazolyl, 2-furyl, 3-furyl, 2-thienyl, 3-thienyl, 2-pyridyl, 3-pyridyl, 4-pyridyl, 2-pyrimidyl, 4-pyrimidyl, 5-benzothiazolyl, purinyl, 2-benzimidazolyl, benzopyrazolyl, 5-indolyl, 1-isoquinolyl, 5-isoquinolyl, 2-quinoxaliny, 5-quinoxaliny, 3-quinolyl, and 6-quinolyl. If not specifically stated, substituents for each of the above noted aryl and heteroaryl ring systems are selected from the group of acceptable substituents described below.

[0024] For brevity, the term "aryl" when used in combination with other terms (*e.g.*, aryloxy, arylthioxy, arylalkyl) includes both aryl and heteroaryl rings as defined above. Thus, the term "arylalkyl" is meant to include those radicals in which an aryl group is attached to an alkyl group (*e.g.*, benzyl, phenethyl, pyridylmethyl and the like).

5 [0025] The term "heterocycle" or "heterocycle" refers to a saturated or unsaturated non-aromatic cyclic group containing at least one sulfur, nitrogen or oxygen heteroatom. Each heterocycle can be attached at any available ring carbon or heteroatom. Each heterocycle may have one or more rings. When multiple rings are present, they can be fused together or linked covalently. Each heterocycle must contain at least one heteroatom (typically 1 to 5
10 heteroatoms) selected from nitrogen, oxygen or sulfur. Preferably, these groups contain 0-5 nitrogen atoms, 0-2 sulfur atoms and 0-2 oxygen atoms. More preferably, these groups contain 0-3 nitrogen atoms, 0-1 sulfur atoms and 0-1 oxygen atoms. Non-limiting examples of heterocycle groups include benzene, pyridine, pyridimidine, pyrazine, morpholin-3-one, piperazine-2-one, pyridine-2-one, piperidine, morpholine, piperazine, isoxazole, isothiazole,
15 pyrazole, imidazole, oxazole, thiazole, isoxazoline, pyrazoline, imidazoline, 1,2,3-triazole, 1,2,4-triazole, 1,3,4-oxadiazole, 1,3,4-thiadiazole, 1,2,4-oxadiazole, 1,2,4-thiadiazole, pyrazol-5-one, pyrrolidine-2,5-dione, imidazolidine-2,4-dione, pyrrolidine, pyrrole, furan, thiophene, and the like.

[0026] The above terms (*e.g.*, "aryl" and "heteroaryl"), in some embodiments, will include
20 both substituted and unsubstituted forms of the indicated radical. Preferred substituents for each type of radical are provided below. For brevity, the terms aryl and heteroaryl will refer to substituted or unsubstituted versions as provided below.

[0027] Substituents for the aryl and heteroaryl groups are varied and are generally selected from: -halogen, -oxo, -OR', -OC(O)R', -NR'R'', -SR', -R', -CN, -NO₂, -CO₂R', -CONR'R'',

Compositions

- 20 [0478] The present invention further provides compositions comprising one or more compounds of formula (I) or a tautomer or a pharmaceutically acceptable salt thereof, and a pharmaceutically acceptable carrier. It will be appreciated that the compounds of formula (I) in this invention may be derivatized at functional groups to provide prodrug derivatives which are capable of conversion back to the parent compounds in vivo. Examples of such
- 25 prodrugs include the physiologically acceptable and metabolically labile ester derivatives, such as methoxymethyl esters, methylthiomethyl esters, or pivaloyloxymethyl esters derived from a hydroxyl group of the compound or a carbamoyl moiety derived from an amino group of the compound. Additionally, any physiologically acceptable equivalents of the compounds of formula (I), similar to metabolically labile esters or carbamates, which are

capable of producing the parent compounds of formula (I) *in vivo*, are within the scope of this invention.

Water or oil-soluble or dispersible products are thereby obtained.

[0481] The compounds utilized in the compositions and methods of this invention may also be modified by appending appropriate functionalities to enhance selective biological properties. Such modifications are known in the art and include those which increase biological penetration into a given biological system (*e.g.*, blood, lymphatic system, central nervous system, etc.), increase oral availability, increase solubility to allow administration by injection, alter metabolism and alter rate of excretion.

[0482] The pharmaceutical compositions of the invention can be manufactured by methods well known in the art such as conventional granulating, mixing, dissolving, encapsulating, lyophilizing, or emulsifying processes, among others. Compositions may be produced in various forms, including granules, precipitates, or particulates, powders, including freeze dried, rotary dried or spray dried powders, amorphous powders, tablets, capsules, syrup,

suppositories, injections, emulsions, elixirs, suspensions or solutions. Formulations may optionally contain stabilizers, pH modifiers, surfactants, bioavailability modifiers and combinations of these.

[0483] Pharmaceutical formulations may be prepared as liquid suspensions or solutions using a sterile liquid, such as oil, water, alcohol, and combinations thereof. Pharmaceutically suitable surfactants, suspending agents or emulsifying agents, may be added for oral or parenteral administration. Suspensions may include oils, such as peanut oil, sesame oil, cottonseed oil, corn oil and olive oil. Suspension preparation may also contain esters of fatty acids, such as ethyl oleate, isopropyl myristate, fatty acid glycerides and acetylated fatty acid glycerides. Suspension formulations may include alcohols, such as ethanol, isopropyl alcohol, hexadecyl alcohol, glycerol and propylene glycol. Ethers, such as poly(ethyleneglycol), petroleum hydrocarbons, such as mineral oil and petrolatum, and water may also be used in suspension formulations.

[0484] Pharmaceutically acceptable carriers that may be used in these compositions include ion exchangers, alumina, aluminum stearate, lecithin, serum proteins, such as human serum albumin, buffer substances, such as phosphates, glycine, sorbic acid, potassium sorbate, partial glyceride mixtures of saturated vegetable fatty acids, water, salts or electrolytes, such as protamine sulfate, disodium hydrogen phosphate, potassium hydrogen phosphate, sodium chloride, zinc salts, colloidal silica, magnesium trisilicate, polyvinyl pyrrolidone, cellulose-based substances, polyethylene glycol, sodium carboxymethylcellulose, polyacrylates, waxes, polyethylene-polyoxypropylene-block polymers, polyethylene glycol and wool fat.

[0485] According to a preferred embodiment, the compositions of this invention are formulated for pharmaceutical administration to a mammal, preferably a human being. Such pharmaceutical compositions of the invention may be administered orally, parenterally, by inhalation spray, topically, rectally, nasally, buccally, vaginally or via an implanted reservoir. The term "parenteral" as used herein includes subcutaneous, intravenous, intramuscular, intra-articular, intra-synovial, intrasternal, intrathecal, intrahepatic, intralesional and intracranial injection or infusion techniques. Preferably, the compositions are administered orally or intravenously. The formulations of the invention may be designed as short-acting, fast-releasing, or long-acting. Still further, compounds can be administered in a local rather than systemic means, such as administration (*e.g.*, injection) as a sustained release formulation.

[0486] Sterile injectable forms of the compositions of this invention may be aqueous or oleaginous suspension. These suspensions may be formulated according to techniques known in the art using suitable dispersing or wetting agents and suspending agents. The sterile injectable preparation may also be a sterile injectable solution or suspension in a non-toxic parenterally acceptable diluent or solvent, for example as a solution in 1,3-butanediol. Among the acceptable vehicles and solvents that may be employed are water, Ringer's solution and isotonic sodium chloride solution. In addition, sterile, fixed oils are conventionally employed as a solvent or suspending medium. For this purpose, any bland fixed oil may be employed including synthetic mono- or di-glycerides. Fatty acids, such as oleic acid and its glyceride derivatives are useful in the preparation of injectables, as are natural pharmaceutically-acceptable oils, such as olive oil or castor oil, especially in their polyoxyethylated versions. These oil solutions or suspensions may also contain a long-chain alcohol diluent or dispersant, such as carboxymethyl cellulose or similar dispersing agents which are commonly used in the formulation of pharmaceutically acceptable dosage forms including emulsions and suspensions. Other commonly used surfactants, such as Tweens, Spans and other emulsifying agents or bioavailability enhancers which are commonly used in the manufacture of pharmaceutically acceptable solid, liquid, or other dosage forms may also be used for the purposes of formulation. Compounds may be formulated for parenteral administration by injection such as by bolus injection or continuous infusion. A unit dosage form for injection may be in ampoules or in multi-dose containers.

[0487] The pharmaceutical compositions of this invention may be in any orally acceptable dosage form, including capsules, tablets, aqueous suspensions or solutions. In the case of tablets for oral use, carriers that are commonly used include lactose and corn starch. Lubricating agents, such as magnesium stearate, are also typically added. For a capsule form, useful diluents include lactose and dried cornstarch. When aqueous suspensions are required for oral use, the active ingredient is combined with emulsifying and suspending agents. If desired, certain sweetening, flavoring or coloring agents may also be added.

[0488] Alternatively, the pharmaceutical compositions of this invention may be in the form of suppositories for rectal administration. These may be prepared by mixing the agent with a suitable non-irritating excipient which is solid at room temperature but liquid at rectal temperature and therefore will melt in the rectum to release the drug. Such materials include cocoa butter, beeswax and polyethylene glycols.

[0489] The pharmaceutical compositions of this invention may also be in a topical form, especially when the target of treatment includes areas or organs readily accessible by topical application, including diseases of the eye, the skin, or the lower intestinal tract. Suitable topical formulations are readily prepared for each of these areas or organs.

5 [0490] Topical application for the lower intestinal tract may be effected in a rectal suppository formulation (see above) or in a suitable enema formulation. Topically-transdermal patches may also be used. For topical applications, the pharmaceutical compositions may be formulated in a suitable ointment containing the active component suspended or dissolved in one or more carriers. Carriers for topical administration of the
10 compounds of this invention include, but are not limited to, mineral oil, liquid petrolatum, white petrolatum, propylene glycol, polyoxyethylene, polyoxypropylene compound, emulsifying wax and water. Alternatively, the pharmaceutical compositions may be formulated in a suitable lotion or cream containing the active components suspended or dissolved in one or more pharmaceutically acceptable carriers. Suitable carriers include
15 mineral oil, sorbitan monostearate, polysorbate 60, cetyl esters, wax, cetyl alcohol, 2-octyldodecanol, benzyl alcohol and water.

[0491] For ophthalmic use, the pharmaceutical compositions may be formulated as micronized suspensions in isotonic, pH adjusted sterile saline, or, preferably, as solutions in isotonic, pH adjusted sterile saline, either with or without a preservative, such as
20 benzalkonium chloride. Alternatively, for ophthalmic uses, the pharmaceutical compositions may be formulated in an ointment, such as petrolatum.

[0492] The pharmaceutical compositions of this invention may also be administered by nasal aerosol or inhalation. Such compositions are prepared according to techniques known in the art of pharmaceutical formulation and may be prepared as solutions in saline,
25 employing benzyl alcohol or other suitable preservatives, absorption promoters to enhance bioavailability, fluorocarbons and/or other conventional solubilizing or dispersing agents.

[0493] Any of the above dosage forms containing effective amounts are within the bounds of routine experimentation and within the scope of the invention. A therapeutically effective dose may vary depending upon the route of administration and dosage form. The preferred
30 compound or compounds of the invention is a formulation that exhibits a high therapeutic index. The therapeutic index is the dose ratio between toxic and therapeutic effects which can be expressed as the ratio between LD₅₀ and ED₅₀. The LD₅₀ is the dose lethal to 50% of

the population and the ED₅₀ is the dose therapeutically effective in 50% of the population. The LD₅₀ and ED₅₀ are determined by standard pharmaceutical procedures in animal cell cultures or experimental animals.

[0494] Besides those representative dosage forms described above, pharmaceutically acceptable excipients and carriers and dosage forms are generally known to those skilled in the art and are included in the invention. It should be understood that a specific dosage and treatment regimen for any particular patient will depend upon a variety of factors, including the activity of the specific compound employed, the age, body weight, general health, sex and diet of the patient, and the time of administration, rate of excretion, drug combination, judgment of the treating physician and severity of the particular disease being treated. The amount of active ingredient(s) will also depend upon the particular compound and other therapeutic agent, if present, in the composition.

Methods of Use

15

[0495] The invention provides methods of inhibiting or decreasing Factor Xa activity as well as treating or ameliorating a Factor Xa associated state, symptom, disorder or disease in a patient in need thereof (e.g., human or non-human). "Treating" within the context of the invention means an alleviation of symptoms associated with a disorder or disease, or halt of further progression or worsening of those symptoms, or prevention or prophylaxis of the disease or disorder.

20

[0496] The term "mammal" includes organisms which express Factor Xa. Examples of mammals include mice, rats, cows, sheep, pigs, goats, horses, bears, monkeys, dogs, cats and, preferably, humans. Transgenic organisms which express Factor Xa are also included in this definition.

25

[0497] The inventive methods comprise administering an effective amount of a compound or composition described herein to a mammal or non-human animal. As used herein, "effective amount" of a compound or composition of the invention includes those amounts that antagonize or inhibit Factor Xa. An amount which antagonizes or inhibits Factor Xa is detectable, for example, by any assay capable of determining Factor Xa activity, including the one described below as an illustrative testing method. Effective amounts may also include those amounts which alleviate symptoms of a Factor Xa associated disorder treatable

30

by inhibiting Factor Xa. Accordingly, "antagonists of Factor Xa" include compounds which interact with the Factor Xa and modulate, *e.g.*, inhibit or decrease, the ability of a second compound, *e.g.*, another Factor Xa ligand, to interact with the Factor Xa. The Factor Xa binding compounds are preferably antagonists of Factor Xa. The language "Factor Xa binding compound" (*e.g.*, exhibits binding affinity to the receptor) includes those compounds which interact with Factor Xa resulting in modulation of the activity of Factor Xa. Factor Xa binding compounds may be identified using an *in vitro* (*e.g.*, cell and non-cell based) or *in vivo* method. A description of an *in vitro* method is provided below.

[0498] The amount of compound present in the methods and compositions described herein should be sufficient to cause a detectable decrease in the severity of the disorder, as measured by any of the assays described in the examples. The amount of Factor Xa modulator needed will depend on the effectiveness of the modulator for the given cell type and the length of time required to treat the disorder. In certain embodiments, the compositions of this invention may further comprise another therapeutic agent. When a second agent is used, the second agent may be administered either as a separate dosage form or as part of a single dosage form with the compounds or compositions of this invention. While one or more of the inventive compounds can be used in an application of monotherapy to treat a disorder, disease or symptom, they also may be used in combination therapy, in which the use of an inventive compound or composition (therapeutic agent) is combined with the use of one or more other therapeutic agents for treating the same and/or other types of disorders, symptoms and diseases. Combination therapy includes administration of the two or more therapeutic agents concurrently or sequentially. The agents may be administered in any order. Alternatively, the multiple therapeutic agents can be combined into a single composition that can be administered to the patient. For instance, a single pharmaceutical composition could comprise the compound or pharmaceutically acceptable salt or solvate according to the formula I, another therapeutic agent (*e.g.*, methotrexate) or a pharmaceutically acceptable salt or solvate thereof, and a pharmaceutically acceptable excipient or carrier.

[0499] The invention comprises a compound having the formula I, a method for making an inventive compound, a method for making a pharmaceutical composition from at least one inventive compound and at least one pharmaceutically acceptable carrier or excipient, and a method of using one or more inventive compounds to treat a variety of disorders, symptoms and diseases (*e.g.*, inflammatory, autoimmune, neurological, neurodegenerative, oncology and cardiovascular), such as RA, osteoarthritis, irritable bowel disease IBD, asthma, chronic

obstructive pulmonary disease COPD and MS. The inventive compounds and their pharmaceutically acceptable salts and/or neutral compositions may be formulated together with a pharmaceutically acceptable excipient or carrier and the resulting composition may be administered in vivo to mammals, such as men, women and animals, to treat a variety of disorders, symptoms and diseases. Furthermore, the inventive compounds can be used to prepare a medicament that is useful for treating a variety of disorders, symptoms and diseases.

Kits

[0500] Still another aspect of this invention is to provide a kit comprising separate containers in a single package, wherein the inventive pharmaceutical compounds, compositions and/or salts thereof are used in combination with pharmaceutically acceptable carriers to treat states, disorders, symptoms and diseases where Factor Xa plays a role.

EXAMPLES

EXAMPLE 1

5-Chloro-thiophene-2-carboxylic acid [3-(4-bromo-phenyl)-4,5-dihydro-isoxazol-5-ylmethyl]-amide (7)

20

SCHEME 1

Step 1:

[0501] Aldehyde 1 was dissolved in 200 mL ethanol, then treated with pyridine (24 mL, 297 mmol) and hydroxylamine hydrochloride (19.58 g, 284 mmol) affording a clear colorless solution which was stirred overnight. The following day the reaction was determined to be complete by HPLC and TLC and was diluted with water (1 L) and filtered affording 2 as a white solid (69 g, quantitative) which contained a small amount of ethanol. ¹H NMR (DMSO-*d*₆, 400 MHz): δ 11.38 (s, 1H), δ 8.09 (s, 1H), δ 7.79 (d, 2H), δ 7.50 (d, 2H).

Step 2:

[0502] The undried product from the previous step (270 mmol, theoretical) was dissolved in DMF (140 mL) and treated with N-chlorosuccinimide (38 g, 284 mmol) affording a yellow suspension which was stirred at room temperature overnight. The following day the reaction was diluted with water (1 L), filtered, then aspirated to dryness affording desired product 3 as a slightly yellow solid (75.6 g, quantitative) which contained a small amount of DMF. ¹H NMR (DMSO-*d*₆, 400 MHz): δ 7.71 (d, 2H), δ 7.68 (d, 2H).

Step 3:

[0503] Carboxylic acid 4 (40 g, 246 mmol) was suspended in dichloromethane (200 mL) then treated with oxalyl chloride (32 mL, 368 mmol) and 15 drops of DMF. The reaction generated a steady flow of gas and was stirred at room temperature overnight. The following day all solids had dissolved and the reaction was pale brown. A small amount was removed, diluted with methanol and a small amount of triethyl amine, concentrated and examined by NMR which showed only the methyl ester. It was concentrated to a brown oil, the flask was then stoppered and sealed with Teflon tape. No yield calculated. Methyl ester: ¹H NMR (DMSO-*d*₆, 400 MHz): δ 7.58 (d, 1H), δ 6.90 (d, 1H), δ 3.82 (s, 3H).

Step 4:

[0504] Allyl amine (56.8 mL, 91 mmol) was dissolved in 100 mL dichloromethane, cooled to 0°C, then treated with triethylamine (21 mL, 155 mmol) followed by slow addition of acid chloride 5 (15 g, 83 mmol) in a small amount of dichloromethane. After the addition was determined to be complete by TLC it was then partitioned with aqueous NaHCO₃ separated, and the organic layer extracted once again with dichloromethane. The combined organic layers were dried over Na₂SO₄, concentrated then purified by filtration through a short plug of silica gel affording the desired product (6) as a light beige crystalline solid (24 g, quant.).

¹H NMR (DMSO-*d*₆, 400 MHz): δ 8.79 (m, 1H), 7.64 (d, 1H), 7.15 (d, 1H), 5.81 (m, 1H), 5.11 (d, 1H), 5.05 (d, 1H), 3.80 (m, 2H).

Step 5:

[0505] Alkene 6 (4.00g, 20 mmol) and triethylamine (3.62 mL, 26 mmol) were heated to 90°C until all solids dissolved. The mixture was then treated with 3 (5.14 g, 22 mmol) slowly over 5 min. After all 3 was added the reaction was checked by TLC and more 3 was added if any starting alkene was present. Upon complete consumption of 6 the reaction mixture was cooled to room temperature, concentrated *in vacuo*, then suspended in a small amount of methanol (ca. 5 mL) and triturated with water affording a white solid. The solid was filtered and dried affording the desired isoxazolidinone (7) as a white solid (6.02 g, 75%). ¹H NMR (DMSO-*d*₆, 400 MHz): δ 8.88 (m, 1H), δ 7.89 (d, 2H), δ 7.80 (d, 2H), δ 7.61 (s, 1H), δ 7.14 (s, 1H), δ 4.90 (m, 1H), δ 3.52 (m, 1H), δ 3.40 (t, 1H), δ 3.21 (dd, 1H).

EXAMPLE 49

(R)-5-Chloro-thiophene-2-carboxylic acid (1-{3-[4-(N,N-dimethyl-carbamimidoyl)-phenyl]-isoxazol-5-yl}-ethyl)-amide

Step 1:

[0553] Methyl ester **8** (4.03 g, 19.9 mmol) was diluted with 40 mL of toluene and cooled to -78°C. Diisobutylaluminum hydride in toluene (26 mL, 40 mmol) was added slowly to the precooled mixture down the side of the flask. The reaction was stirred at -78°C for two hours at which time it was treated slowly with ca. 5 mL of methanol precooled to -78°C (vigorous reaction). The mixture was then warmed to rt and partitioned with saturated sodium potassium tartrate and ethyl acetate. The layers were separated, the organic phase was extracted with ethyl acetate and the combined organic layers were dried over MgSO₄. After filtration and concentration *in vacuo* the crude material was purified by filtration through a short plug of silica gel eluted with dichloromethane affording the aldehyde **9** as a colorless oil (2.23g, 65%). ¹H NMR (DMSO-*d*₆, 400 MHz): δ 9.38 (s, 1H), δ 7.30 (d, 1H), δ 3.79 (m, 1H), δ 1.31 (s, 9H), 1.06 (d, 3H).

Step 2:

[0554] Triphenylphosphine (6.0 g, 23.1 mmol) was dissolved in 30 mL of dichloromethane and cooled to 0°C. To this was added CBr₄ (3.84 g, 11.6 mmol), slowly, resulting in a clear orange solution. After stirring 10 min aldehyde **9** (1.0 g, 5.78 mmol) was added slowly resulting in a dark red, cloudy solution. This was then checked by TLC which showed complete consumption of the starting material and a less polar spot. The reaction was concentrated *in vacuo* then filtered through a short pad of silica gel (eluted with dichloromethane) affording the desired olefin **10** as an off-white crystalline solid (1.25 g, 66%). ¹H NMR (DMSO-*d*₆, 400 MHz): δ 7.36 (d, 1H), δ 5.18 (s, 1H), δ 4.23 (m, 1H), δ 1.35 (s, 9H), δ 1.28 (d, 3H).

Step 3:

[0555] Dibromoolefin **10** (1.25 g, 3.8 mmol) was dissolved with THF (10 mL), cooled to 0°C, then treated with freshly prepared lithium diisopropyl amide (1.7 M, 20 mL) during which time the reaction changed from colorless to dark yellow-orange. The ice bath was removed and the reaction stirred for 10 min. The reaction was then partitioned with 1 M HCl and ethyl acetate, the layers separated and the aqueous phase extracted again with ethyl acetate. The combined organic layers were dried over MgSO₄, filtered, concentrated and purified by silica gel chromatography (dichloromethane) affording the desired alkyne (**11**) as a white solid (0.3652 g, 57%). ¹H NMR (CDCl₃, 400 MHz): δ 4.71 (br s, 1H), δ 4.42 (br s, 1H), δ 2.20 (s, 1H), δ 1.38 (s, 9H), δ 1.32 (d, 3H).

Step 4:

[0556] Performed in the same manner as in step 5, Example 1. NMR (DMSO-*d*₆, 400 MHz): δ 8.01 (d, 2H), δ 7.95 (d, 2H), δ 7.54 (d, 1H), δ 6.91 (s, 1H), δ 4.81 (m, 1H), δ 1.36 (m, 12H).

5 Step 5:

[0557] Boc protected amine **12** was diluted with 4 M HCl/dioxane (10 mL) and stirred for 2 hrs at which time it was determined to be complete by TLC. The reaction was concentrated affording the desired amine as a white solid which was used immediately for the next step.

10 NMR (DMSO-*d*₆, 400 MHz): δ 8.72 (s, 3H), δ 8.06 (d, 2H), δ 8.02 (d, 2H), δ 7.29 (s, 1H), δ 4.73 (m, 1H), δ 1.59 (d, 3H).

Step 6:

[0558] Performed in the same manner as in step 5, Example 1. NMR (DMSO-*d*₆, 400 MHz): δ 9.11 (d, 1H), δ 8.03 (d, 2H), δ 7.95 (d, 2H), δ 7.70 (d, 2H), δ 7.18 (d, 1H), δ 7.51 (s, 1H), δ 5.29 (m, 1H), δ 1.50 (d, 3H).

Step 1:

[0811] 4-Iodoaniline (32, 6.00 g, 27.4 mmol) was dissolved in 25 mL TFA and stirred in ice bath. Solid NaNO₂ (2.07 g, 30.1 mmol) was added in small portions. The resulting mixture was stirred for 30 min in the ice bath. Sodium azide (1.87 g, 28.8 mmol) was

dissolved in 10 mL water and chilled in ice bath. This cold solution was then added to the TFA solution in three portions. The mixture was stirred in ice bath for 1 hr and concentrated in vacuo to remove TFA. The residue was taken into 600 mL DCM and washed with water three times. The organic phase was dried using MgSO_4 and concentrated in vacuo to afford 1-azido-4-iodobenzene **33** as a brownish waxy solid in >99% yield. In the mean time, 5-chlorothiophene-2-carboxylic acid (**4**, 9.13 g, 56 mmol) was dissolved in 200 mL dry DCM along with 0.5 mL dry DMF. SCHEME 20

Step 1:

[0958] 5-Amino-2-chloropyridine (**120**, 4.91 g, 38.3 mmol) was dissolved in 15 mL TFA. In ice bath to it was added NaNO_2 (2.91 g, 42.2 mmol) in small portions. The mixture was stirred in the cold bath for 30 min. To it was then added an ice-cold solution of NaN_3 (2.50 g, 38.3 mmol, in 10 mL water). The mixture was stirred for 1 hr. The mixture was concentrated in vacuo and diluted with 400 mL chloroform. It was washed with water three times, dried, concentrated and purified by flash column to yield compound **121** (3.46 g, 59%). MS found for $\text{C}_5\text{H}_3\text{ClN}_4$ as $(\text{M}+\text{H})^+$ 155.0, 157.0.

The reaction was still in complete. The mixture was concentrated and subjected to flash column to isolate major 1,4-disubstituted triazole product **122** (3.19 g, 40%) as a white solid. MS found for $\text{C}_{13}\text{H}_9\text{Cl}_2\text{N}_5\text{OS}$ as $(\text{M}+\text{H})^+$ 354.0, 356.0. The minor 1,5-triazole isomer was isolated in 7% yield (0.56 g).

Step 3:

[0960] The mixture of compound **122** (50 mg, 0.14 mmol), N-methylhomopiperazine (53 μL , 0.42 mmol) and Cs_2CO_3 (91 mg, 0.28 mmol) in 1 mL DMSO in a sealed tube was stirred in 120°C bath for 2 hr. The mixture was directly subjected to reverse phase preparative HPLC to

EXAMPLE 404

[0981] This example illustrates methods for evaluating the compounds of the invention, along with results obtained for such assays. The *in vitro* and *in vivo* Factor Xa isoform activities of the inventive compounds can be determined by various procedures known in the art, such as a test for their ability to inhibit the activity of the Factor Xa isoform. The potent affinities for Factor Xa isoform exhibited by the inventive compounds can be measured by an IC_{50} value (in nM). The IC_{50} value is the concentration (in nM) of the compound required to

provide 50% inhibition of Factor Xa isoform. The smaller the IC_{50} value, the more active (potent) is a compound for inhibiting Factor Xa isoform.

[0982] An *in vitro* assay for detecting and measuring inhibition activity against Factor Xa is as follows:

5 *IC₅₀ and K_i Determinations:*

Substrate:

The substrate S-2765 (Z-D-Arg-Gly-Arg-pNA·HCl) was obtained from Diapharma (West Chester, OH).

10 Enzyme:

The human plasma protein factor Xa was purchased from Haematologic Technologies (Essex Junction, VT).

Methods

15 *IC₅₀ determinations*

[0983] All assays, which are performed in 96-well microtiter plates, measure proteolytic activity of the enzyme (factor Xa) by following cleavage of paranitroanilide substrate. The assay buffer used for proteolytic assays was Tris buffered saline (20mM Tris, 150mM NaCl, 5mM CaCl₂, 0.1% Bovine serum albumin (BSA), 5% Dimethyl Sulfoxide (DMSO) pH 7.4).

20 In a 96-well microtiter plate, inhibitor was serially diluted to give a range of concentrations from 0.01nM to 10μM (final). Duplicate sets of wells were assayed and control wells without inhibitor were included. Enzyme was added to each well, (fXa concentration = 1nM), the plate was shaken for 5 seconds and then incubated for 5 minutes at room temperature. S2765 was added (100 μM final) and the plate was shaken for 5 seconds (final liquid volume
25 in each well was 200μl). The degree of substrate hydrolysis was measured at 405 nm on a Thermomax plate reader (Molecular Devices, Sunnyvale, CA) for 2 minutes. The initial velocities (mOD/min), for each range of inhibitor concentrations, were fitted to a four parameter equation using Softmax data analysis software. The parameter C, derived from the resulting curve-fit, corresponded to the concentration for half maximal inhibition (IC_{50}).

30

K_i determination

[0984] The assay buffer for this series of assays was Hepes buffered saline (20mM Hepes, 150mM NaCl, 5mM CaCl₂, 0.1% PEG-8000, pH 7.4). In a 96-well microtiter plate, inhibitor

was serially diluted in a duplicate set of wells to give a range of final concentrations from 5pM to 3µM final. Controls without inhibitor (8 wells) were included. The enzyme, fXa (1nM final) was added to the wells. The substrate S-2765 (200µM final) was added and the degree of substrate hydrolysis was measured at 405nm on a Thermomax plate reader for 5 minutes, using Softmax software. Initial velocities (mOD/min) were analyzed by non-linear least squares regression in the Plate Ki software (BioKin Ltd, Pullman, WA)(Literature reference: Kusmic P, Sideris S, Cregar LM, Elrod KC, Rice KD, Janc J. High-throughput screening of enzyme inhibitors: Automatic determination of tight-binding inhibition constants. *Anal. Biochemistry* 2000, **281**:62-67). The model used for fitting the inhibitor dose-response curves was the Morrison equation. An apparent K_i (K_i^*) was determined. The overall K_i was calculated using the following equation:

$$K_i = \frac{K_i^*}{1 + \frac{[S]}{K_m}}$$

where [S] is substrate concentration (200µM) and K_m , the Michaelis constant for S2765.

15 *The hERG (human ether-a-go-go related gene protein) Membrane Binding Assay*
[0985] Human embryonic kidney (HEK293) cells stably transfected with hERG cDNA were used for preparation of membranes (Literature reference: Zhou, Z., Gong, Q., Ye, B., Fan, Z., Makielski, C., Robertson, G., January, CT., Properties of HERG stably expressed in HEK293 cells studied at physiological temperature. *Biophys. J*, 1998, **74**:230-241). The assay buffer was comprised of 50 mM Tris, 10 mM KCl, 1 mM MgCl₂, pH 7.4. Competition assays for hERG binding were performed, in a 96 well plate, with 50 µL ³H- dofetilide, at a concentration of 3.5 nM (final concentration of 0.01% ethanol). Test compound was added at final concentrations of 100 µM, 33.33 µM, 11.11 µM, 3.70 µM, 1.23 µM, 0.41 µM, 0.14 µM, 0.046 µM, 0.015 µM, and 0.005 µM (1.0% DMSO). Each compound was run in duplicate on each of two plates. Total binding was determined by addition of 50 µL of assay buffer in place of compound. Non-specific binding was determined by addition of 50 µL of 50 µM terfenadine in place of test compound. All assays were initiated by addition of 150 µL of membrane homogenates (15 ug protein/well as final concentration) to the wells (total volume = 250 µL per well), and the plates were incubated at room temperature for 80 minutes on a shaking platform. All assays were terminated by vacuum filtration on to glass fiber filters, followed by two washes with cold assay buffer. The filter plates were dried at 55°C for 90

minutes, after which, Microscint 0 (50 μ L) was added to each well of the dried filter plate. The plates were counted on a Packard Topcount (Perkin Elmer, Boston, MA) using a one minute protocol. Scintillation reading (counts per minute, CPM) data generated by the Packard TopCount was used to calculate the percent inhibition of ^{3} H-dofetilide binding, for each compound at each concentration, using the total binding control value corrected for non-specific binding. The IC_{50} value was calculated from the percent inhibition curve generated using Excel XL Fit software (Microsoft). The equilibrium dissociation constant (K_i) was calculated using the equation of Cheng and Prusoff (see "Relationship between the inhibition constant (K_i) and the concentration of inhibitor which causes 50 per cent inhibition (I_{50}) of an enzymatic reaction," *Biochem Pharmacol.*, 1973, **22(23)**:3099-108.

$$K_i = IC_{50} / [1 + ([L] / K_D)].$$

[0986] A compound can be run through this assay and its corresponding IC_{50} inhibition value can be calculated from the assay data.
