PULSATOR OF WASHING MACHINE

A pulsator of a washing machine which can enhance a cleaning efficiency is provided to generate a complicated water stream. Pulsator (1) includes outer pulsating member (2) which has a plurality of large-sized outer blades (22) thereon and central pulsating member (4) which has a plurality of center blades (24) formed on a hemispheric surface located on a rotational axis, and intermediate pulsating member (3) which is rotatably inserted onto a recess portion between central pulsating member (4) and outer pulsating member (2) and has a plurality of intermediate blades (23) thereon, with the outer pulsating member and the central pulsating member being molded as a single body. In case outer pulsating member (2) and central pulsating member (4) are rotationally driven by the rotational axis, intermediate pulsating member (3) is thereby rotated so that the complicated water stream is generated.
