

Summary

An infusion unit with a bag part (21) containing an infusion material, preferably tea leaves, and a handle (22) that is connected to the bag part (21) is specified. Such an infusion unit is to be improved in such a way that it is suitable for preparing high-quality infusion beverages, especially for street vending. To this end, the invention proposes that the handle (22) be a plate-type element, preferably made of paper, cardboard or plastic, to which the bag part (21) is fastened directly in such a way that, viewed in a direction of the elongate extension of the handle (22), it is arranged between opposite ends (23, 24) of the handle (22) such that when the handle (22) and bag part (21) are tilted about 90° from one another, the handle (22) extends to both sides beyond a point of connection of the handle (22) to the bag part (21).
