Abstract

Connector for a plurality of switching assemblies with compatible interfaces

A connector (1) for the fixing and contact-making of a plurality of switching assemblies (2) having compatible interfaces on a substrate (3) has a plurality of receptacle devices (51, 52, ...) with contact elements (7) and also internal contact connections (10) between corresponding contact elements (7), as a result of which the length of connections between the switching assemblies (2) is reduced, signal propagation times are shortened and a higher clock rate for operation of the switching assemblies (2) is made possible.
