

Metering Brush for Targeted Local Application

Abstract

The invention concerns a brush for metered application of a cosmetic or pharmaceutical liquid with a configuration from a number of at least essentially parallel-arranged bristles, which are grouped around a configuration center (7), in which the bristles are molded onto a bristle support (1), the configuration having an outer configuration area (3) enclosing the configuration center in the peripheral direction, in which the bristle density is higher than in the inner configuration area (4) enclosed by the outer configuration area (3) and/or whose bristles are finer than the bristles of the inner configuration area (4).
