

[NAME OF DOCUMENT] ABSTRACT

It is possible to decide whether or not a service can be used without requiring a manual operation and giving a burden to the user when account registration and collaboration are executed in the process of an SSO.

A policy storage unit of an ID provider device according to an embodiment stores, for each service provider ID, policy information representing a user to which transmission of service data is permitted and policy information representing a user of a target in which transmission permission of service data is deleted. When a predetermined cycle comes or when a use status of the service provider device changes, the ID provider device acquires use status information of the service provider device transmitted from the service provider device, and updates a service use status storage unit based on the acquired use status information. When the service use status storage unit is updated, the ID provider device decides a deletion target account of each service provider ID.
