(54) Title: METHOD AND SYSTEM FOR MODELLING OR TRANSFORMING A PROCESS

Figure 3

(57) Abstract: A computer implemented method of transforming a process into a software application for performing a sequence of tasks of the process is disclosed herein. In the described embodiment, the method comprises (i) providing a plurality of predetermined process commands and choice objects for selection by a user, each of the plurality of predetermined process commands defining an action to be performed for a corresponding task, and wherein each of the plurality of predetermined choice objects are representations of physical objects or information objects required for performing the interrelated task; (ii) receiving input which selects combinations of the plurality of process commands and the plurality of choice objects to form respective process activities (500, 502, 504, 506, 508, 510) for suitably describing the sequence of tasks for constructing the process, the process activities being associated with a mapping module which maps each process activity to at least one executable program for performing the process activity; and (iii) creating the software application for the process based on the mapped executable programs.
