

STATOR VANE INTEGRATED ATTACHMENT LINER AND SPRING DAMPER

ABSTRACT

5 A stator subassembly includes an array of circumferentially arranged stator
vanes. An attachment liner secures the stator vanes to one another to provide the
subassembly. A damper spring is integral with the attachment liner and is provided
between the array and an outer case, which supports the array. The damper spring is
configured to bias the array radially inwardly from the outer case.
