

TITLE OF THE APPLICATION

HCV NS3 PROTEASE INHIBITORS

FIELD OF THE INVENTION

5 The present invention relates to macrocyclic compounds that are useful as inhibitors of the hepatitis C virus (HCV) NS3 protease, the synthesis of such compounds, and the use of such compounds for treating HCV infection and/or reducing the likelihood or severity of symptoms of HCV infection.

10 BACKGROUND OF THE INVENTION

 Hepatitis C virus (HCV) infection is a major health problem that leads to chronic liver disease, such as cirrhosis and hepatocellular carcinoma, in a substantial number of infected individuals, estimated to be 2-15% of the world's population. There are an estimated 3.9 million infected people in the United States alone, according to the U.S. Center for Disease Control,
15 roughly five times the number of people infected with the human immunodeficiency virus (HIV). According to the World Health Organization, there are more than 170 million infected individuals worldwide, with at least 3 to 4 million people being infected each year. Once infected, about 20% of people clear the virus, but about 80% of those infected harbor HCV the rest of their lives. Ten to 20% of chronically infected individuals eventually develop liver-
20 destroying cirrhosis or cancer. The viral disease is transmitted parenterally by contaminated blood and blood products, contaminated needles, or sexually and vertically from infected mothers or carrier mothers to their off-spring.

 Current treatments for HCV infection, which are restricted to immunotherapy with recombinant interferon- α alone or in combination with the nucleoside analog ribavirin, are
25 of limited clinical benefit. Moreover, there is no established vaccine for HCV. Consequently, there is an urgent need for improved therapeutic agents that effectively combat chronic HCV infection. The current state of the art in the treatment of HCV infection has been discussed in the following references: B. Dymock et al., "Novel approaches to the treatment of hepatitis C virus infection," 11 Antiviral Chem. & Chemotherapy 79-96 (2000); H. Rosen et al., "Hepatitis C
30 virus: current understanding and prospects for future therapies," 5 Molec. Med. Today 393-399 (1999); D. Moradpour et al., "Current and evolving therapies for hepatitis C," 11 Euro. J. Gastroenterol. Hepatol. 1189-1202 (1999); R. Bartenschlager, "Candidate Targets for Hepatitis C

Virus-Specific Antiviral Therapy," 40(5-6) Intervirology 378-393 (1997); G.M. Lauer & B.D. Walker, "Hepatitis C Virus Infection," 345 N. Engl. J. Med. 41-52 (2001); B.W. Dymock, "Emerging therapies for hepatitis C virus infection," 6 Emerging Drugs 13-42 (2001); and C. Crabb, "Hard-Won Advances Spark Excitement about Hepatitis C," Science: 506-507 (2001).

5 Several virally-encoded enzymes are putative targets for therapeutic intervention, including a metalloprotease (NS2-3), a serine protease (NS3), a helicase (NS3), and an RNA-dependent RNA polymerase (NS5B). The NS3 protease is located in the N-terminal domain of the NS3 protein. Because it is responsible for an intramolecular cleavage at the NS3/4A site and for downstream intermolecular processing at the NS4A/4B, NS4B/5A and NS5A/5B junctions,
10 the NS3 protease is considered a prime drug target. Previous research has identified classes of peptides, such as hexapeptides as well as tripeptides discussed in U.S. Patent Application Publications US2005/0020503, US2004/0229818, and US2004/00229776, showing degrees of activity in inhibiting the NS3 protease. The aim of the present invention is to provide further compounds which exhibit activity against the HCV NS3 protease.

As used herein, all ranges are inclusive, and all sub-ranges are included within such ranges, although not necessarily explicitly set forth. In addition, the term "or," as used herein, denotes alternatives that may, where appropriate, be combined; that is, the term "or" includes each listed alternative separately as well as their combination.

As used herein, the term "alkyl" refers to any linear or branched chain alkyl group having a number of carbon atoms in the specified range. Thus, for example, "C₁₋₆ alkyl" (or "C₁-C₆ alkyl") refers to all of the hexyl alkyl and pentyl alkyl isomers as well as n-, iso-, sec- and t-butyl, n- and isopropyl, ethyl and methyl. As another example, "C₁₋₄ alkyl" refers to n-, iso-, sec- and t-butyl, n- and isopropyl, ethyl and methyl. Alkyl groups may be substituted as indicated.

The term "halogenated" refers to a group or molecule in which a hydrogen atom has been replaced by a halogen. Similarly, the term "haloalkyl" refers to a halogenated alkyl group. The term "halogen" (or "halo") refers to atoms of fluorine, chlorine, bromine and iodine (alternatively referred to as fluoro, chloro, bromo, and iodo).

The term "alkoxy" refers to an "alkyl-O-" group. Alkoxy groups may be substituted as indicated.

The term "alkylene" refers to any linear or branched chain alkylene group (or alternatively "alkanediyl") having a number of carbon atoms in the specified range. Thus, for example, "-C₁₋₆ alkylene-" refers to any of the C₁ to C₆ linear or branched alkylenes. A class of alkylenes of particular interest with respect to the invention is -(CH₂)₁₋₆-, and sub-classes of particular interest include -(CH₂)₁₋₄-, -(CH₂)₁₋₃-, -(CH₂)₁₋₂-, and -CH₂-. Also of interest is the alkylene -CH(CH₃)-. Alkylene groups may be substituted as indicated.

The term "cycloalkyl" refers to any cyclic ring of an alkane or alkene having a number of carbon atoms in the specified range. Thus, for example, "C₃₋₈ cycloalkyl" (or "C₃-C₈

cycloalkyl”) refers to cyclopropyl, cyclobutyl, cyclopentyl, cyclohexyl, cycloheptyl, and cyclooctyl. The term “cycloalkoxy” refers to a “cycloalkyl-O-” group. Cycloalkyl groups may be substituted as indicated.

The term “carbocycle” (and variations thereof such as “carbocyclic” or “carbocyclyl”) as used herein, unless otherwise indicated, refers to (i) a C₃ to C₈ monocyclic, saturated or unsaturated ring or (ii) a C₇ to C₁₂ bicyclic saturated or unsaturated ring system. Each ring in (ii) is either independent of, or fused to, the other ring, and each ring is saturated or unsaturated. Carbocycle groups may be substituted as indicated, for example with C₁₋₆ alkyl, C₁₋₆ alkenyl, C₁₋₆ alkynyl, aryl, halogen, -NH₂ or -OH. The carbocycle may be attached to the rest of the molecule at any carbon atom which results in a stable compound. The fused bicyclic carbocycles are a subset of the carbocycles; i.e., the term “fused bicyclic carbocycle” generally refers to a C₇ to C₁₀ bicyclic ring system in which each ring is saturated or unsaturated and two adjacent carbon atoms are shared by each of the rings in the ring system. A fused bicyclic carbocycle in which both rings are saturated is a saturated bicyclic ring system. Saturated carbocyclic rings are also referred to as cycloalkyl rings, e.g., cyclopropyl, cyclobutyl, etc. A fused bicyclic carbocycle in which one or both rings are unsaturated is an unsaturated bicyclic ring system. A subset of the fused bicyclic unsaturated carbocycles are those bicyclic carbocycles in which one ring is a benzene ring and the other ring is saturated or unsaturated, with attachment via any carbon atom that results in a stable compound. Representative examples

Depicted ring systems include, where appropriate, an indication of the variable to

which a particular ring atom is attached. For example, the indole structure

shows ring atom 2 is directly attached to variable X and ring atom 4 is directly attached to variable Z.

Variable R⁵ is shown as a floating variable which can be attached to any ring atom, provided that such attachment results in formation of a stable ring.

The term "aryl" refers to aromatic mono- and poly-carbocyclic ring systems, also referred to as "arenes," wherein the individual carbocyclic rings in the polyring systems are fused or attached to each other via a single bond. Suitable aryl groups include phenyl, naphthyl, and biphenylenyl. Aryl groups may be substituted as indicated.

5 Unless indicated otherwise, the term "heterocycle" (and variations thereof such as "heterocyclic" or "heterocyclyl") broadly refers to (i) a stable 4- to 8-membered, saturated or unsaturated monocyclic ring, (ii) a stable 7- to 12-membered bicyclic ring system, or (iii) a stable 11- to 15-membered tricyclic ring system, wherein each ring in (ii) and (iii) is independent of, or fused to, the other ring or rings and each ring is saturated or unsaturated, and the monocyclic
10 ring, bicyclic ring system or tricyclic ring system contains one or more heteroatoms (e.g., from 1 to 6 heteroatoms, or from 1 to 4 heteroatoms) independently selected from N, O and S and a balance of carbon atoms (the monocyclic ring typically contains at least one carbon atom and the bicyclic and tricyclic ring systems typically contain at least two carbon atoms); and wherein any one or more of the nitrogen and sulfur heteroatoms is optionally oxidized, and any one or more
15 of the nitrogen heteroatoms is optionally quaternized. Unless otherwise specified, the heterocyclic ring may be attached at any heteroatom or carbon atom, provided that attachment results in the creation of a stable structure. Heterocycle groups may be substituted as indicated, and unless otherwise specified, the substituents may be attached to any atom in the ring, whether a heteroatom or a carbon atom, provided that a stable chemical structure results.

20 Saturated heterocyclics form a subset of the heterocycles. Unless expressly stated to the contrary, the term "saturated heterocyclic" generally refers to a heterocycle as defined above in which the entire ring system (whether mono- or poly-cyclic) is saturated. The term "saturated heterocyclic ring" refers to a 4- to 8-membered saturated monocyclic ring, a stable 7- to 12-membered bicyclic ring system, or a stable 11- to 15-membered tricyclic ring system,
25 which consists of carbon atoms and one or more heteroatoms independently selected from N, O and S. 30 Unsaturated heterocyclics form another subset of the heterocycles. Unless expressly stated to the contrary, the term "unsaturated heterocyclic" generally refers to a heterocycle as defined above in which the entire ring system (whether mono- or poly-cyclic) is not saturated, i.e., such rings are either unsaturated or partially unsaturated. Unless expressly

stated to the contrary, the term "heteroaromatic ring" refers a stable 5- or 6-membered monocyclic aromatic ring, a stable 7- to 12-membered bicyclic ring system, or a stable 11- to 15-membered tricyclic ring system, which consists of carbon atoms and one or more heteroatoms selected from N, O and S. In the case of substituted heteraromatic rings containing at least one nitrogen atom (e.g., pyridine), such substitutions can be those resulting in N-oxide formation. Representative examples of heteroaromatic rings include pyridyl, pyrrolyl, pyrazinyl, pyrimidinyl, pyridazinyl, thienyl (or thiophenyl), thiazolyl, furanyl, imidazolyl, pyrazolyl, triazolyl, tetrazolyl, oxazolyl, isooxazolyl, oxadiazolyl, thiazolyl, isothiazolyl, and thiadiazolyl.

certain contexts herein,  is alternatively referred to as phenyl having as a substituent methylenedioxy attached to two adjacent carbon atoms.

Unless otherwise specifically noted as only "unsubstituted" or only "substituted", alkyl, cycloalkyl, aryl and heterocycle groups are unsubstituted or substituted. Preferably, the substituents are selected from the group which includes, but is not limited to, halo, C₁-C₂₀ alkyl, -CF₃, -NH₂, -N(C₁-C₆ alkyl)₂, -NO₂, oxo, -CN, -N₃, -OH, -O(C₁-C₆ alkyl), C₃-C₁₀ cycloalkyl, C₂-C₆ alkenyl, C₂-C₆ alkynyl, (C₀-C₆ alkyl) S(O)₀₋₂-, aryl-S(O)₀₋₂-, (C₀-C₆ alkyl)S(O)₀₋₂(C₀-C₆ alkyl)-, (C₀-C₆ alkyl)C(O)NH-, H₂N-C(NH)-, -O(C₁-C₆ alkyl)CF₃, (C₀-C₆ alkyl)C(O)-, (C₀-C₆ alkyl)OC(O)-, (C₀-C₆alkyl)O(C₁-C₆ alkyl)-, (C₀-C₆ alkyl)C(O)₁₋₂(C₀-C₆ alkyl)-, (C₀-C₆ alkyl)OC(O)NH-, aryl, aralkyl, heteroaryl, heterocyclylalkyl, halo-aryl, halo-aralkyl, halo-heterocycle, halo-heterocyclylalkyl, cyano-aryl, cyano-aralkyl, cyano-heterocycle and cyano-heterocyclylalkyl.

Unless expressly stated to the contrary, all ranges cited herein are inclusive. For example, a heteroaryl ring described as containing from "1 to 3 heteroatoms" means the ring can contain 1, 2, or 3 heteroatoms. It is also to be understood that any range cited herein includes

within its scope all of the sub-ranges within that range. The oxidized forms of the heteroatoms N and S are also included within the scope of the present invention.

When any variable (e.g., R^7 and R^{10}) occurs more than one time in any constituent or in formula (I) or in any other formula depicting and describing compounds of the invention, its definition on each occurrence is independent of its definition at every other occurrence. Also, combinations of substituents and/or variables are permissible only if such combinations result in stable compounds.

Unless expressly stated to the contrary, substitution by a named substituent is permitted on any atom in a ring (e.g., aryl, a heteroaromatic ring, or a saturated heterocyclic ring) provided such ring substitution is chemically allowed and results in a stable compound. A "stable" compound is a compound which can be prepared and isolated and whose structure and properties remain or can be caused to remain essentially unchanged for a period of time sufficient to allow use of the compound for the purposes described herein (e.g., therapeutic or prophylactic administration to a subject).

As a result of the selection of substituents and substituent patterns, certain of the compounds of the present invention can have asymmetric centers and can occur as mixtures of stereoisomers, or as individual diastereomers, or enantiomers. All isomeric forms of these compounds, whether isolated or in mixtures, are within the scope of the present invention.

As would be recognized by one of ordinary skill in the art, certain of the compounds of the present invention can exist as tautomers. For the purposes of the present invention a reference to a compound of formula (I) is a reference to the compound per se, or to any one of its tautomers per se, or to mixtures of two or more tautomers.

The compounds of the present inventions are useful in the inhibition of HCV protease (e.g., HCV NS3 protease) and the treatment of HCV infection and/or reduction of the likelihood or severity of symptoms of HCV infection. For example, the compounds of this invention are useful in treating infection by HCV after suspected past exposure to HCV by such means as blood transfusion, exchange of body fluids, bites, accidental needle stick, or exposure to patient blood during surgery.

The compounds of this invention are useful in the preparation and execution of screening assays for antiviral compounds. For example, the compounds of this invention are useful for isolating enzyme mutants, which are excellent screening tools for more powerful antiviral compounds. Furthermore, the compounds of this invention are useful in establishing or

determining the binding site of other antivirals to HCV protease, e.g., by competitive inhibition. Thus, the compounds of this invention may be commercial products to be sold for these purposes.

5 The compounds of the present invention may be administered in the form of pharmaceutically acceptable salts. The term "pharmaceutically acceptable salt" refers to a salt which possesses the effectiveness of the parent compound and which is not biologically or otherwise undesirable (e.g., is neither toxic nor otherwise deleterious to the recipient thereof). Suitable salts include acid addition salts which may, for example, be formed by mixing a solution of the compound of the present invention with a solution of a pharmaceutically
10 acceptable acid such as hydrochloric acid, sulfuric acid, acetic acid, trifluoroacetic acid, or benzoic acid. Many of the compounds of the invention carry an acidic moiety, in which case suitable pharmaceutically acceptable salts thereof can include alkali metal salts (e.g., sodium or potassium salts), alkaline earth metal salts (e.g., calcium or magnesium salts), and salts formed with suitable organic ligands such as quaternary ammonium salts. Also, in the case of an acid
15 (-COOH) or alcohol group being present, pharmaceutically acceptable esters can be employed to modify the solubility or hydrolysis characteristics of the compound.

The term "administration" and variants thereof (e.g., "administering" a compound) in reference to a compound of the invention mean providing the compound or a prodrug of the compound to the individual in need of treatment. When a compound of the
20 invention or a prodrug thereof is provided in combination with one or more other active agents (e.g., antiviral agents useful for treating HCV infection), "administration" and its variants are each understood to include concurrent and sequential provision of the compound or salt (or hydrate) and other agents.

As used herein, the term "prodrug" is intended to encompass an inactive drug
25 form or compound that is converted into an active drug form or compound by the action of enzymes, chemicals or metabolic processes in the body of an individual to whom it is administered.

As used herein, the term "composition" is intended to encompass a product comprising the specified ingredients, as well as any product which results, directly or indirectly,
30 from combining the specified ingredients.

By "pharmaceutically acceptable" is meant that the ingredients of the pharmaceutical composition must be compatible with each other and not deleterious to the recipient thereof.

The term "subject" (alternatively referred to herein as "patient") as used herein refers to an animal, preferably a mammal, most preferably a human, who has been the object of treatment, observation or experiment.

The term "effective amount" as used herein means that amount of active compound or pharmaceutical agent that elicits the biological or medicinal response in a tissue, system, animal or human that is being sought by a researcher, veterinarian, medical doctor or other clinician. In one embodiment, the effective amount is a "therapeutically effective amount" for the alleviation of one or more symptoms of the disease or condition being treated. In another embodiment, the effective amount is a "prophylactically effective amount" for reduction of the severity or likelihood of one or more symptoms of the disease or condition. The term also includes herein the amount of active compound sufficient to inhibit HCV NS3 protease and thereby elicit the response being sought (i.e., an "inhibition effective amount"). When the active compound (i.e., active ingredient) is administered as the salt, references to the amount of active ingredient are to the free acid or free base form of the compound.

For the purpose of inhibiting HCV NS3 protease and treating HCV infection and/or reducing the likelihood or severity of symptoms of HCV infection, the compounds of the present invention, optionally in the form of a salt or a hydrate, can be administered by any means that produces contact of the active agent with the agent's site of action. They can be administered by any conventional means available for use in conjunction with pharmaceuticals, either as individual therapeutic agents or in a combination of therapeutic agents. They can be administered alone, but typically are administered with a pharmaceutical carrier selected on the basis of the chosen route of administration and standard pharmaceutical practice. The compounds of the invention can, for example, be administered orally, parenterally (including subcutaneous injections, intravenous, intramuscular, intrasternal injection or infusion techniques), by inhalation (such as in a spray form), or rectally, in the form of a unit dosage of a pharmaceutical composition containing an effective amount of the compound and conventional non-toxic pharmaceutically-acceptable carriers, adjuvants and vehicles. Liquid preparations suitable for oral administration (e.g., suspensions, syrups, elixirs and the like) can be prepared according to techniques known in the art and can employ any of the usual media such as water,

glycols, oils, alcohols and the like. Solid preparations suitable for oral administration (e.g., powders, pills, capsules and tablets) can be prepared according to techniques known in the art and can employ such solid excipients as starches, sugars, kaolin, lubricants, binders, disintegrating agents and the like. Parenteral compositions can be prepared according to techniques known in the art and typically employ sterile water as a carrier and optionally other ingredients, such as solubility aids. Injectable solutions can be prepared according to methods known in the art wherein the carrier comprises a saline solution, a glucose solution or a solution containing a mixture of saline and glucose. Further description of methods suitable for use in preparing pharmaceutical compositions of the present invention and of ingredients suitable for use in said compositions is provided in Remington's Pharmaceutical Sciences, 18th edition (ed. A. R. Gennaro, Mack Publishing Co., 1990).

The compounds of this invention can be administered orally in a dosage range of 0.001 to 1000 mg/kg of mammal (e.g., human) body weight per day in a single dose or in divided doses. One dosage range is 0.01 to 500 mg/kg body weight per day orally in a single dose or in divided doses. Another dosage range is 0.1 to 100 mg/kg body weight per day orally in single or divided doses. For oral administration, the compositions can be provided in the form of tablets or capsules containing 1.0 to 500 mg of the active ingredient, particularly 1, 5, 10, 15, 20, 25, 50, 75, 100, 150, 200, 250, 300, 400, and 500 mg of the active ingredient for the symptomatic adjustment of the dosage to the patient to be treated. The specific dose level and frequency of dosage for any particular patient may be varied and will depend upon a variety of factors including the activity of the specific compound employed, the metabolic stability and length of action of that compound, the age, body weight, general health, sex, diet, mode and time of administration, rate of excretion, drug combination, the severity of the particular condition, and the host undergoing therapy.

As noted above, the present invention also relates to a method of inhibiting HCV NS3 protease, inhibiting HCV replication, treating HCV infection and/or reducing the likelihood or severity of symptoms of HCV infection with a compound of the present invention in combination with one or more therapeutic agents and a pharmaceutical composition comprising a compound of the present invention and one or more therapeutic agents selected from the group consisting of a HCV antiviral agent, an immunomodulator, and an anti-infective agent. Such therapeutic agents active against HCV include, but are not limited to, ribavirin, levovirin, viramidine, thymosin alpha-1, R7025 (an enhanced interferon (Roche)), interferon- β , interferon-

α, pegylated interferon-α (peginterferon-α), a combination of interferon-α and ribavirin, a combination of peginterferon-α and ribavirin, a combination of interferon-α and levovirin, and a combination of peginterferon-α and levovirin. Interferon-α includes, but is not limited to, recombinant interferon-α2a (such as Roferon interferon available from Hoffmann-LaRoche, Nutley, NJ), pegylated interferon-α2a (Pegasys™), interferon-α2b (such as Intron-A interferon available from Schering Corp., Kenilworth, NJ), pegylated interferon-α2b (PegIntron™), a recombinant consensus interferon (such as interferon alphacon-1), albuferon (interferon-α bound to human serum albumin (Human Genome Sciences)), and a purified interferon-α product. Amgen's recombinant consensus interferon has the brand name Infergen®. Levovirin is the L-enantiomer of ribavirin which has shown immunomodulatory activity similar to ribavirin. Viramidine represents an analog of ribavirin disclosed in International Patent Application Publication WO 01/60379. In accordance with the method of the present invention, the individual components of the combination can be administered separately at different times during the course of therapy or concurrently in divided or single combination forms.

For the treatment of HCV infection, the compounds of the present invention may also be administered in combination with an agent that is an inhibitor of HCV NS3 serine protease. HCV NS3 serine protease is an essential viral enzyme and has been described to be an excellent target for inhibition of HCV replication. Both substrate and non-substrate based inhibitors of HCV NS3 protease inhibitors are disclosed in International Patent Application Publications WO 98/22496, WO 98/46630, WO 99/07733, WO 99/07734, WO 99/38888, WO 99/50230, WO 99/64442, WO 00/09543, WO 00/59929, WO 02/48116 and WO 02/48172, British Patent No. GB 2 337 262, and U.S. Patent No. 6,323,180.

Ribavirin, levovirin, and viramidine may exert their anti-HCV effects by modulating intracellular pools of guanine nucleotides via inhibition of the intracellular enzyme inosine monophosphate dehydrogenase (IMPDH). IMPDH is the rate-limiting enzyme on the biosynthetic route in *de novo* guanine nucleotide biosynthesis. Ribavirin is readily phosphorylated intracellularly and the monophosphate derivative is an inhibitor of IMPDH. Thus, inhibition of IMPDH represents another useful target for the discovery of inhibitors of HCV replication. Therefore, the compounds of the present invention may also be administered in combination with an inhibitor of IMPDH, such as VX-497, which is disclosed in International Patent Application Publications WO 97/41211 and WO 01/00622; another IMPDH inhibitor,

such as that disclosed in WO 00/25780; or mycophenolate mofetil. See A.C. Allison and E.M. Eugui, 44 (Suppl.) Agents Action 165 (1993).

For the treatment of HCV infection, the compounds of the present invention may also be administered in combination with the antiviral agent amantadine (1-aminoadamantane).

5 For a comprehensive description of this agent, see J. Kirschbaum, 12 Anal. Profiles Drug Subs. 1-36 (1983).

For the treatment of HCV infection, the compounds of the present invention may also be administered in combination with the antiviral agent polymerase inhibitor R7128 (Roche).

10 The compounds of the present invention may also be combined for the treatment of HCV infection with antiviral 2'-C-branched ribonucleosides disclosed in R. E. Harry-O'Kuru et al., 62 J. Org. Chem. 1754-59 (1997); M. S. Wolfe et al., 36 Tet. Lett. 7611-14 (1995); U.S. Patent No. 3,480,613; and International Patent Application Publications WO 01/90121, WO 01/92282, WO 02/32920, WO 04/002999, WO 04/003000 and WO 04/002422; the contents
15 of each of which are incorporated by reference in their entirety. Such 2'-C-branched ribonucleosides include, but are not limited to, 2'-C-methyl-cytidine, 2'-C-methyl-uridine, 2'-C-methyl-adenosine, 2'-C-methyl-guanosine, and 9-(2-C-methyl- β -D-ribofuranosyl)-2,6-diaminopurine, and the corresponding amino acid ester of the ribose C-2', C-3', and C-5' hydroxyls and the corresponding optionally substituted cyclic 1,3-propanediol esters of the 5'-
20 phosphate derivatives.

The compounds of the present invention may also be combined for the treatment of HCV infection with other nucleosides having anti-HCV properties, such as those disclosed in International Patent Application Publications WO 02/51425, assigned to Mitsubishi Pharma Corp.; WO 01/79246, WO 02/32920, WO 02/48165 and WO2005/003147 (including R1656,

The HCV NS3 protease inhibitory activity of the present compounds may be
 tested using assays known in the art. One such assay is HCV NS3 protease time-resolved
 25 fluorescence (TRF) assay as described below and in International Patent Application Publication
 WO2006/102087. Other examples of such assays are described in e.g., International Patent
 Application Publication WO2005/046712. HCV NS3 protease inhibitors, such as those
 described herein have a K_i less than 50 μM , such as less than 10 μM , and less than 100 nM. K_i
 is determined by an NS3 protease assay. The assay is performed in a final volume of 100 μl in
 30 assay buffer containing 50 mM HEPES, pH 7.5, 150 mM NaCl, 15 % glycerol, 0.15 % Triton X-
 100, 10 mM DTT, and 0.1 % PEG 8000. NS3 protease is pre-incubated with various
 concentrations of inhibitors in DMSO for 30 minutes. The reaction is initiated by adding the

TRF peptide substrate (final concentration 100 nM). NS3 mediated hydrolysis of the substrate is quenched after 1 hour at room temperature with 100 µl of 500 mM MES, pH 5.5. Product fluorescence is detected using either a VICTOR V2 or FUSION fluorophotometer (Perkin Elmer Life and Analytical Sciences) with excitation at 340 nm and emission at 615 nm with a 400 µs delay. Testing concentrations of different enzyme forms are selected to result in a signal to background ratio (S/B) of 10-30. IC₅₀ values are derived using a standard four-parameter fit to the data. K_i values are derived from IC₅₀ values using the following formula,

$$IC_{50} = K_i (1 + [S] / K_M), \quad \text{Eqn (1),}$$

where [S] is the concentration of substrate peptide in the reaction and K_M is the Michaelis constant. See P. Gallinari et al., 38 BIOCHEM. 5620-32(1999); P. Gallinari et al., 72 J. VIROL. 6758-69 (1998); M. Taliani et al., 240 ANAL. BIOCHEM. 60-67 (1996).

The present invention also includes processes for making compounds of formula (I). Synthesis of Intermediates**Intermediates A**

Intermediate #	Structure	Name	Literature Reference
A1		(1 <i>R</i> ,2 <i>S</i>)-1-Amino- <i>N</i> -(cyclopropylsulfonyl)-2-vinylcyclopropanecarboxamide hydrochloride	US 6,995,174
A2		Ethyl (1 <i>R</i> ,2 <i>S</i>)-1-amino-2-vinylcyclopropanecarboxylate hydrochloride	US 6,323,180

Intermediate A3: (1*R*,2*R*)-1-Amino-*N*-(cyclopropylsulfonyl)-2-ethylcyclopropanecarboxamide hydrochloride

Step 1: *t*-Butyl ((1*R*,2*R*)-1-{[(cyclopropylsulfonyl)amino]carbonyl}-2-ethylcyclopropyl)carbamate

A hydrogenation vessel was charged with a MeOH (1000 mL) slurry of *t*-butyl ((1*R*,2*S*)-1-{[(cyclopropylsulfonyl)amino]carbonyl}-2-vinylcyclopropyl)carbamate (164 g, 0.50 mol) (US 6,995,174) and 5% Ru/C (dry, 7.5 wt%, 12.4 g) and stirred. The vessel was placed under N₂ (20 psi) and vented to atmospheric pressure (3x) to remove residual oxygen. The vessel was then placed under H₂ (50 psi). After 20 hours, the vessel was vented to atmospheric pressure. The reaction slurry was then transferred out of the reaction vessel and filtered through SOLKA FLOK (34 g, wetted with 100 mL MeOH) to yield a clear, light brown solution. The SOLKA FLOK was rinsed with MeOH (200 mL x 2). The combined MeOH solutions were concentrated under reduced pressure to yield crude product as a white solid (153 g). The crude product was slurried in EtOAc (800 mL), warmed to 40°C and aged 30 minutes. The solution was then seeded, aged 30 minutes, and heptane (500 mL) was added via addition funnel over 30 minutes. The partially crystallized solid was cooled to RT and aged overnight, after which additional heptane (500 mL) was added. After 1 hour, additional heptane (250 mL) was added *via* addition funnel, and the white slurry aged for 1 hour. The solution was filtered, and the solid was rinsed with heptane/EtOAc (500 mL, 4:1) and dried under reduced pressure to give *t*-butyl ((1*R*,2*R*)-1-{[(cyclopropylsulfonyl)amino]carbonyl}-2-ethylcyclopropyl)carbamate (125.9 g).

Step 2: (1*R*,2*R*)-1-Amino-*N*-(cyclopropylsulfonyl)-2-ethylcyclopropanecarboxamide hydrochloride (Intermediate A3)

A solution of the product from Step 1 (92 g, 0.28 mol) in DCM (1200 mL) was cooled to 0°C, and HCl was bubbled through the solution for 10 minutes. The cooling bath was

then removed, and the reaction mixture stirred for 2 hours. N₂ was bubbled through the reaction mixture for 5 minutes, and the volatiles evaporated. The residue was azeotroped with DCM (3x) to give an off-white powder (75 g). LRMS (M+H)⁺ Calcd. = 233; found 233.

5 Intermediate A4: *Trans*-4-pent-4-en-1-yltetrahydrofuran-3-ol

To a mixture of CuI (1.66 g, 8.71 mmol) in THF (100 mL) at -5°C, a 0.5M solution of bromo(pent-4-en-1-yl)magnesium (116 mL, 5.81 mmol) was added. The solution was stirred for 1 hour and cooled to -20°C. 3,6-Dioxabicyclo[3.1.0]hexane (5.0 g, 58.1 mmol) was added dropwise, and the reaction mixture was slowly warmed to RT and stirred for 15 hours. The reaction mixture was quenched with NH₄Cl_(aq) and extracted with Et₂O (3x). The combined organics were washed with H₂O and brine, dried over Na₂SO₄, filtered and concentrated. The crude product was purified on SO₂ (gradient elution, 10-100% EtOAc/hexanes). ¹H NMR (500 MHz, CDCl₃) δ 5.83 – 5.75 (m, 1 H); 5.04 – 4.95 (m, 2 H); 4.14 – 4.07 (m, 3 H); 3.85 (m, 1 H); 3.70 (m, 1 H); 3.44 (m, 1 H); 2.07 (m, 3 H); 1.45 (m, 3 H) ppm.

Intermediate A5: *Trans*-2-pent-4-en-1-ylcyclopentanol

A solution of 5-bromopent-1-ene (11.81 mL, 100 mmol) in Et₂O (100 mL) was added to magnesium (2.43 g, 100 mmol) over 20 minutes. The resulting suspension was heated under reflux for 40 minutes, then cooled to 20°C, taken up in a syringe, and added dropwise at -5°C to a stirred suspension of CuI (3.17 g, 16.6 mmol) in THF (160 mL). The resulting solution was stirred for 30 minutes at -5°C, then cooled to -20°C. Cyclopentene oxide (7.21 mL, 83 mmol) was added dropwise, and the resulting mixture was warmed to 20°C over 2 hours, then stirred for 48 hours. The reaction was quenched by addition of NH₄Cl_(aq); then the layers were separated, and the aqueous layer was extracted with Et₂O. The combined organic phases were washed with H₂O and brine, then dried over Na₂SO₄. Filtration and removal of the volatiles gave a residue that was purified by column chromatography on SiO₂ (gradient elution, 1-100% EtOAc/petroleum ether) to afford the title compound (7.92 g, 62%) as a liquid. ¹H NMR (400

MHz, CDCl_3) δ 5.88-5.76 (m, 1H), 5.01 (d, $J = 17.2$ Hz, 1H), 4.95 (d, $J = 10.6$ Hz, 1H), 3.83 (br s, 1H), 2.12-2.00 (m, 2H), 1.99-1.84 (m, 2H), 1.76-1.30 (m, 7H), 1.24-1.11 (m, 2H).

Intermediate A6: (1R,2R)-2-pent-4-en-1-ylcyclopentyl acetate
