

CHAIR**Abstract of the Disclosure**

A chair having a structure wherein mounting members such as a seat portion, a seat back portion and armrest portions, can readily be secured to a frame.

The chair has a frame having seat frames, a stay for connecting the seat frames on both sides, a seat back frame, etc. The mounting member has, on its back side face, hook pieces which open toward one direction so that the hook pieces can engage with a part of the frame from the side direction; standing walls disposed along the side face of another part of the frame; and fastening pieces disposed along the back side face of another part of the frame. The mounting member is secured to the frame by engaging the hook pieces with one side of the frame and by surrounding another part of the frame with the standing walls and the fastening pieces.
