ABSTRACT

A method and apparatus for flipping Integrated Circuits Chips

The present invention relates generally to an automated machine, more particularly, to apparatus and method for flipping integrated circuit (IC) chips and the like. An apparatus for flipping Integrated Circuit Chips comprising a chip holder; a holder rotating means which is mounted in a fixed position with a chip holder receiving recess; means for bringing chip one at a time in contact into said recess; wherein when necessary the rotating means is actuated in order to rotate the chip holder.
