COMMUNICATION METHOD AND RELATED APPARATUS

ABSTRACT

A communication method and a related apparatus are disclosed, applied to the field of short-range communication technologies. In this application, a first node is separately connected to a second node and a third node, and the second node and the third node are managed by the first node. The first node may generate first information, send the first information to the second node, and send the first information to the third node. The second node and the third node separately receive the first information, and perform, based on the first information, security protection on data transmitted between the second node and the third node. This application can implement direct and secure data transmission between two nodes managed by another node, thereby improving data transmission efficiency and communication security.
