

WASHING MACHINE

ABSTRACT

A washing machine includes a detergent case that is provided with a first storage chamber in which a detergent is stored, and a channel structure part that forms a channel above the detergent case. The channel structure part is provided with a plurality of dropping holes that direct water from the channel toward the detergent case. The detergent case includes a separation wall that separates the first storage chamber into a mixing chamber where the detergent and the water are mixed to produce a solution of the detergent, and a foaming chamber where the solution flowing from the mixing chamber is foamed. The plurality of dropping holes include a first dropping hole that directs the water toward the mixing chamber, and a second dropping hole that directs the water toward the foaming chamber.
