

ABSTRACT

A method and a device for transmitting configuration information related to measurement control. The base station generates configuration information for measurement control, the configuration information including a first set of configuration information, a second set of configuration information and a determination condition. The first set of configuration information is related to a first measurement target, the first measurement target is related to a known moving trajectory, and the second set of configuration information is related to a second measurement target, the second measurement target is related to an unknown moving trajectory. The base station sends the configuration information to a user device to instruct the user device to adopt the first set of configuration information for cell measurement when the determination condition is met and to adopt the second set of configuration information for cell measurement when the determination condition is not met.
