# METHOD AND SYSTEM FOR INFORMATION HANDLING SYSTEM CONSUMABLES AUTOMATED ORDERING

## ABSTRACT OF THE DISCLOSURE

An automated consumable ordering system and method obtains an information handling system purchaser's preferences for ordering consumables used by devices of an information handling system ordered for manufacture and loads the consumable ordering preferences on a consumable ordering module of the information handling system during manufacture. Consumable usage by the information handling system is tracked to a predetermined level at which the module orders consumables automatically from the manufacturer. The order is placed with a message that uses a service tag number associated with the information handling system. The manufacturer determines account information for charging the order from the service tag. The module updates account information by directing the user of the information handling system to perform updates through a secure Internet connection with the manufacturer or other secure established connection.
