

【ABSTRACT】

SLIDE-TYPE LIPSTICK CASE

5 Disclosed is a slide-type lipstick container in which a
button and a button guide slit, into which the button is fitted,
are formed in an outer circumferential surface of an external
case, a slide member, which moves a lipstick up and down, is
coupled to ribs of the button and a lower end of a lipstick holder,
10 studs are formed at upper and lower portions of the button guide
slit, and friction protrusions are formed on the ribs of the
button so that the friction protrusions make friction with the
button guide slit to control the vertical movement of the button,
thereby preventing the lipstick from being pushed down when the
15 lipstick container is used and allowing the lipstick container
to smoothly operate when the lipstick container is operated.
