

ABSTRACT OF THE DISCLOSURE**A LOCK DEVICE ENABLING A HANDLE TO BE ROTATED FREELY WHEN IN A LOCK POSITION**

A lock device has a case (60), a pair of identical and superposed flowers (61, 62) pivotally mounted within the case (60), a sliding block (68) movably mounted within the case (60) and having a protrusion (681) formed therewith, a presser (66) securely connected with one of the flowers (61) and alternatively connected with the other one of the flowers (61, 62), a leverage (67) securely connected with the presser (66) and alternatively connected with the protrusion (681) of the sliding block (68) and a tongue member (69) movably mounted onto a side of the case (60) and having a plate (693) formed therewith and movably connected with the presser (66). Since the presser (66) is alternatively in contact with both or one of the flowers, a door will still be locked even a rotation of an outdoor handle is possible.
