

ABSTRACT

A reinforced frame structure (3) includes main poles (31), a surrounding member (32) encircling the main poles (31) for defining an accommodation space (34) having a polygonal outline, and at least
5 one plate member (33) connected to the surrounding member (32). The surrounding member (32) has a plurality of surrounding units (321) and connecting units (322) welded to the main poles (31). Each surrounding unit (321) is integrally bent and then continues to each connecting unit (322). Each connecting unit (322) extends inclinedly
10 between any two adjacent surrounding units (321). Therefore, the surrounding member (32) is bent in succession for encircling the main poles (31), which reinforces the strength of the frame structure (3) and allows the length thereof to be adjustable according to demand. The plate member (33) is directly fixed to a construction material
15 (4) like a corrugated board to attain quick installation and the convenience of use.
