

(57) **Abstract:** A manipulating device for an entertainment system is provided which overcomes the problems that might occur when an excessive force is applied thereto and permits smooth operation. A manipulating device 1 comprises an operating portion (10) and a stopper portion (40) that supports the operating portion (10). Leg portions (41) of the stopper portion (40) opens when depressive pressure is applied to the operating portion (10), and closes and restores the operating portion (10) to its initial position when the depressive pressure is released.
