

## ABSTRACT

The present application discloses a data processing method and device. The method includes: receiving a data update request sent by a user; sending a log update instruction separately to a primary server and at least two secondary servers based on  
5 the data update request; and when it is determined that the log update operation is completed, sending a data storage instruction separately to the primary server and a first secondary server in the at least two secondary servers. When the data update request is received, the log update instruction can be sent to the primary server and the secondary servers, so that the primary server and the secondary servers perform a log  
10 update operation, and the data storage instruction is sent to the primary server and one of the secondary servers when it is determined that the log update operation is completed. When data in the secondary server is lost, the lost data can be restored by using the prestored log, so as to ensure data consistency between the primary server and the secondary server, and only the primary server and one of the secondary  
15 servers store the data updates, thereby effectively reducing resources needed for data storage.
