AGE ALLOTMENT METHOD

A method of stock control for food retailing, in which a first batch of product produced between a pair of dates is marked with a colour associated with that period and a second
5 later batch is associated with a different colour.

A series of 4-6 colours denote a 4-9 week period per colour. The retail staff remember the sequence and recalls and stock rotation is simplified.

10 Packages are described in which the colour is on a label, wrapper or tag.
