

AN INTRUSION PROTECTION SYSTEM AND METHOD**ABSTRACT**

5 An intrusion protection system and method protect host computers of a
computer network from network intrusions. All inbound and outbound transmissions of
individual host computers are monitored to detects any unauthorised events. The Once
an unauthorised event is detected the inbound and outbound transmissions of a host
computer are locked down, thereby isolating the host computer from the rest of the
10 computer network. A global network security provider provides further security services
remotely.
