

COMBUSTION EQUIPMENT

ABSTRACT

5 A combustion equipment includes: a combustion device for burning fuel containing chlorine element; a supply device for supplying sulfur-containing additives to the combustion device; an adjustment device for adjusting supply amounts of the sulfur-containing additives with the supply device; and a detection device for detecting an amount of chlorine element in a combustion gas generated by combustion of the fuel in the combustion device. The
10 adjustment device adjusts the supply amounts such that the value of F_S/F_{Cl} falls within a predetermined range, where F_{Cl} is a detection value for the detection device and F_S is a supply amount of sulfur supplied to the combustion device for supplying the sulfur-containing additives to the combustion device with the supply device.
