

ABSTRACT

Provided are group management methods and apparatuses, and an electronic device and a storage medium. A method comprises: a server acquiring an order delivery state of a target order (S101); if the order delivery state meets a set state, acquiring a delivery party identifier of the target order, and on the basis of the delivery party identifier, updating a group member set of an interaction group corresponding to a transaction party related to the target order, so as to obtain an updated group member set (S102); and generating member update information on the basis of the updated group member set, and sending the member update information to a delivery end (S103), so that the delivery end displays or does not display a group entry to the interaction group on the basis of the member update information. On the basis of the order delivery state of the target order, a group member update is performed on the interaction group corresponding to the transaction party, so that automatic management of a delivery party joining a group and leaving the group is implemented, thereby improving the management efficiency, and facilitating information sharing between delivery parties.
