**METHOD FOR FORMATTING COMPRESSED  
VIDEO DATA INTO TRANSPORT CELLS**

Abstract of the Disclosure

A digital compressed video signal transmission system includes a transport processor (FIG. 7) for segmenting (105,115) compressed data into transport cells for transmission. Particular 5 portions of the compressed data are formatted (110,120,125) into further transport cells, which further transport cells are interspersed with normally occurring transport cells. The further transport cells include redundant video signal data which may be utilized to resynchronize a compressed video signal decoder after 10 loss or corruption of transmitted data.
