**METHOD OF MAKING ELECTRONIC COMPONENT
USING REWORKABLE ADHESIVES**

5 The priority of US provisional application 60/091506 is claimed under
35 USC 119(e).

 This invention relates to a method of making an electronic component
adhered to a substrate with a reworkable adhesive composition.

 Adhesive compositions, particularly conductive adhesives, are used
10 for a variety of purposes in the fabrication and assembly of semiconductor
packages and other electronic devices. The more prominent uses are the
bonding of integrated circuit chips to lead frames or other substrates, and the
bonding of circuit packages or assemblies to printed wire boards.

 The requirements for conductive adhesives in electronic packaging
15 are that they have good mechanical strength, curing properties that do not
affect the component or the carrier, and thixotropic properties compatible with
existing application equipment currently used in the industry.

25 JUN 1999

This Sheet Has Been Replaced

Another important aspect of an adhesive bonding or interconnection technology is the ability to rework the bond. For single chip packaging involving high volume commodity products, a failed chip can be discarded without significant loss. However, it becomes expensive to discard multi-chip packages with only one failed chip; consequently, the ability to rework the failed chip would be a manufacturing advantage. Today, one of the primary thrusts within the semiconductor industry is to develop adhesives that will meet all the requirements for adhesive strength and flexibility, but that will also be reworkable.

Conventional adhesive technology uses low viscosity thermosetting organic materials. In order to achieve the required mechanical performance, relatively high molecular weight thermoplastics would be the preferred compositions. These materials, however, have high viscosity or even solid film form, which are drawbacks to the manufacturing process. Thus, there is a need for new compositions that are easily dispensable in current manufacturing processes, and that are reworkable.

This invention is a method for making an electronic component adhered to a substrate using a reworkable adhesive. The electronic component may be an active integrated circuit chip or any other active component, or any passive component, that is mechanically and electrically adhered to a substrate.

The reworkable adhesive composition comprises one or more compounds containing one or more carbon to carbon double bonds (hereinafter referred to a vinyl functionality), a free-radical initiator and/or a photoinitiator, and optionally one or more fillers. The preferred compounds are those as described later in this specification.

A compound containing one vinyl functionality will be referred to hereinafter as a mono-functional compound. A compound containing more than one vinyl functionality will be referred to hereinafter as a poly-functional compound.

5 The composition is designed to be reworkable by choosing a major amount of mono-functional compounds for the composition. The ability to process these thermoplastic compositions easily is achieved by using relatively low molecular weight reactive oligomers or pre-polymers and curing them *in situ* after application to the electronic assembly. The relatively low
10 molecular weight translates to a lower viscosity and ease of application to the substrate.

The method comprises the steps:

- (a) providing a curable reworkable adhesive composition comprising
- 15 (i) one or more mono-functional vinyl compounds, in a major amount effective to provide thermoplastic properties, and
- (ii) optionally, one or more poly-functional vinyl compounds, in a minor amount ineffective to diminish the thermoplastic properties of the cured composition,
- (iii) a curing initiator selected from the group consisting of a
20 free-radical initiator, a photoinitiator, and a combination of those;
- (iv) optionally, one or more fillers;
- (v) optionally, one or more adhesion promoters;
- (b) disposing the curable composition between the electronic
component and the substrate; and
- 25 (c) curing the composition *in situ*.

This Sheet Has Been Replaced

The compounds used in the adhesive compositions of this invention are curable compounds, meaning that they are capable of polymerization, with or without crosslinking. As used in this specification, to cure will mean to polymerize, with or without crosslinking. Cross-linking, as is understood in the art, is the attachment of two polymer chains by bridges of an element, a molecular group, or a compound, and in general will take place upon heating. As cross-linking density is increased, the properties of a material can be changed from thermoplastic to thermosetting.

It is possible to prepare polymers of a wide range of cross-link density by the judicious choice and amount of mono- or polyfunctional compounds. The greater proportion of polyfunctional compounds reacted, the greater the cross-link density. In order to provide thermoplastic properties, the adhesive compositions of this invention will be prepared from mono-functional compounds to limit the cross-link density. However, a minor amount of polyfunctional compounds can be added to provide some cross-linking and strength to the composition, provided the amount of poly-functional compounds is limited to an amount that does not diminish the desired thermoplastic properties. Within these parameters, the strength and elasticity of individual adhesives can be tailored to a particular end-use application.

The cross-link density can also be controlled to give a wide range of glass transition temperatures in the cured adhesive to withstand subsequent processing and operation temperatures.

In those cases where it is necessary to rework the assembly, the electronic component can be pried off the substrate, and any residue adhesive can be heated until it softens and is easily removed.

In the inventive adhesive compositions, the vinyl compounds will be present in the curable adhesive compositions in an amount from 2 to 98

This Sheet Has Been Replaced

weight percent based on the organic components present (excluding any fillers).

The adhesive compositions will further comprise at least one free-radical initiator, which is defined to be a chemical species that decomposes to a molecular fragment having one or more unpaired electrons, highly reactive and usually short-lived, which is capable of initiating a chemical reaction by means of a chain mechanism. The free-radical initiator will be present in an amount of 0.1 to 10 percent, preferably 0.1 to 3.0 percent, by weight of the vinyl compounds (excluding any filler). The free radical curing mechanism gives a fast cure and provides the composition with a long shelf life before cure. Preferred free-radical initiators include peroxides, such as butyl peroctoates and dicumyl peroxide, and azo compounds, such as 2,2'-azobis(2-methyl-propanenitrile) and 2,2'-azobis(2-methyl-butanenitrile).

Alternatively, the adhesive compositions may contain a photoinitiator, such as is sold by Ciba Specialty Chemicals under the trademark Irgacure, in lieu of the free-radical initiator, and the curing process may then be initiated by UV radiation. The photoinitiator will be present in an amount of 0.1 to 10 percent, preferably 0.1 to 3.0 percent, by weight of the maleimide or vinyl compound, or a combination of both maleimide and vinyl compounds (excluding any filler). In some cases, both photoinitiation and free-radical initiation may be desirable. For example, the curing process can be started by UV irradiation, and in a later processing step, curing can be completed by the application of heat to accomplish a free-radical cure.

In general, these compositions will cure within a temperature range of 80°C to 180°C, and curing will be effected within a length of time of 5 to 30 minutes. As will be understood, the time and temperature curing profile each adhesive composition will vary, and different compositions can be designed to

provide the curing profile that will be suited to the particular industrial manufacturing process.

Suitable conductive fillers for the adhesives are, for example, silver, copper, gold, palladium, and platinum.

- 5 Fillers may also be inorganic, such as polymer particles, to adjust rheology or to improve toughness.

As used throughout this specification, the notation C(O) refers to a carbonyl group.

- The compounds suitable for use in the adhesive compositions of this
10 invention have a structure represented by one of the formulae:

M represents a vinyl group and can be the maleimide moiety having the structure:

in which R¹ is H or C₁ to C₅ alkyl; or

- 15 or the vinyl moiety having the structure:

in which R¹ and R² are H or an alkyl having

- 1 to 5 carbon atoms, or together form a 5 to 9 membered ring with the carbons forming the vinyl group; B is C, S, N, O, C(O), O-C(O), C(O)-O, C(O)NH or C(O)N(R^a), in which R^a is C₁ to C₅ alkyl. Preferably, B is O, C(O), O-C(O), C(O)-O, C(O)NH or C(O)N(R^a); more preferably B is O, C(O), O-C(O), C(O)-O, or C(O)N(R^a).
- 20

X independently is an aromatic group selected from the aromatic groups having the structures (I) through (V):

Lower case "m" is 0 or 1, and lower case "n" is 1 to 6. When lower case "n" is the integer 1, the compound will be a mono-functional compound; and when lower case "n" is an integer 2 to 6, the compound will be a poly-functional compound.

15 The more preferred maleimide compounds, particularly for use as reworkable materials, are N-butylphenyl maleimide and N-ethylphenyl maleimide.

This Sheet Has Been Replaced

Other Composition Components

Depending on the nature of the substrate to which the adhesive is to be bonded, the adhesive may also contain a coupling agent. A coupling agent as used herein is a chemical species containing a polymerizable functional group for reaction with the maleimide and other vinyl compound, and a functional group capable of condensing with metal hydroxides present on the surface of the substrate. Such coupling agents and the preferred amounts for use in compositions for particular substrates are known in the art. Suitable coupling agents are silanes, silicate esters, metal acrylates or methacrylates, titanates, and compounds containing a chelating ligand, such as phosphine, mercaptan, and acetoacetate. When present, coupling agents typically will be in amounts up to 10 percent by weight, and preferably in amounts of 0.1-3.0 percent by weight, of the maleimide and other monofunctional vinyl compound.

In addition, the adhesive compositions may contain compounds that lend additional flexibility and toughness to the resultant cured adhesive. Such compounds may be any thermoset or thermoplastic material having a Tg of 50°C or less, and typically will be a polymeric material characterized by free rotation about the chemical bonds, such as can be obtained by the presence of carbon-carbon double bonds adjacent to carbon-carbon single bonds, the presence of ester and ether groups, and the absence of ring structures. Suitable such modifiers include polyacrylates, poly(butadiene), polyTHF (polymerized tetrahydrofuran), CTBN (carboxy-terminated butyronitrile) rubber, and polypropylene glycol. When present, toughening compounds may be in an amount up to about 15 percent by weight of the maleimide and other monofunctional vinyl compound.

This Sheet Has Been Replaced

If siloxane moieties are not part of the maleimide or vinyl compound structure, siloxanes can be added to the package formulations to impart elastomeric properties. Suitable siloxanes are the methacryloxypropyl-terminated polydimethyl siloxanes, and the aminopropyl-terminated polydimethylsiloxanes, available from United Chemical Technologies.

The composition may also contain organic fillers, such as, polymers to adjust rheology. Other additives known and used in the art may also be used for specific purposes, such as, adhesion promoters. The selection of the types and amounts suitable is within the expertise of one skilled in the art.

10

Performance Properties

These compositions will perform within the commercially acceptable range for die attach adhesives. Commercially acceptable values for die shear for the adhesives on a 80 X 80 mil² silicon die are in the range of less than or equal to 1 kg at room temperature, and less than or equal to 0.5 kg at 240°C, and for warpage for a 500 X 500 mil² die are in the range of less than or equal to 70 μm at room temperature.

The coefficient of thermal expansion (CTE) is the change in dimension per unit change in temperature for a given material. Different materials will have different rates of expansion, and rates of expansion for any given material will vary with the temperature. If the CTE is very different for elements attached together, thermal cycling can cause the attached elements to bend, crack, or delaminate. In a typical semiconductor assembly, the CTE of the chip is in the range of 2 or 3 ppm/°C; for organic circuit board substrate, the CTE is greater than 30 ppm/°C; therefore, the CTE of the adhesive is best close to that of the substrate.

20

25

This Sheet Has Been Replaced

When a polymer is subjected to the application of heat, it will move through a transition region between a hard, glassy state to a soft, rubbery state. This region is known as the glass transition region or T_g . If a graph of expansion of the polymer versus temperature is plotted, the glass transition region is the intersection between the lower temperature/glassy region coefficient of thermal expansion and the higher temperature/rubbery region coefficient of thermal expansion. Above this region, the rate of expansion increases significantly. Consequently, it is preferred that the glass transition of the polymer be higher than normal operating temperatures experienced during the application, and if reworkability is needed, that the glass transition be lower than any rework temperature.

EXAMPLES

Various vinyl compounds were prepared and formulated into adhesive compositions. The compositions were investigated for viscosity and thixotropic index for the uncured composition, and for curing profile, glass transition temperature, coefficient of thermal expansion, thermal mechanical analysis, and reworkability for the cured composition.

EXAMPLE 1.

Preparation of Benzamido-endcapped Dimer Diamine Bismaleimide

5

Dimer diamine (sold as Versamine 552 by Henkel, 20.0 g, 37 mmol)
 was solvated in diethyl ether (Et_2O) (200 mL) in a 500 mL three-necked flask
 equipped with an addition funnel, magnetic stirring, internal temperature probe
 and nitrogen inlet/outlet. NaOH_{aq} (11.7 mL of 6.25 M solution diluted with 100
 10 mL H_2O , 73 mmol) was added with vigorous stirring. This solution was
 placed under a steady flow of nitrogen and cooled to 3°C on an ice bath with
 stirring. The addition funnel was charged with *p*-nitrobenzoyl chloride (13.6 g,

This Sheet Has Been Replaced

73 mmol) in Et₂O (50 mL), and this solution was added to the reaction vessel over the course of 60 minutes, maintaining an internal T<10°C. The reaction was stirred at ~3°C for an additional 60 minutes after this addition was complete, then allowed to warm to room temperature and stirred for another 4
5 hours. The solution was transferred to a separatory funnel and the isolated organic layer washed with distilled H₂O (300 mL), 5% HCl_{aq} (300 mL), NaCl_{aq} (250 mL) and distilled H₂O (2x250 mL). The organics were isolated, dried over MgSO₄ anhyd., filtered and the solvent removed *in vacuo* to yield the dinitro compound as a viscous yellow oil which exhibited acceptable ¹H NMR
10 and IR spectra (30.0 g, 96 %).

The dinitro compound described above (5.0 g, 5.9 mmol) was dissolved in methanol (MeOH) (25 mL) and tetrahydrofuran (THF) (5 mL) in a 250 mL three-necked flask equipped with magnetic stirring, reflux condensor and nitrogen inlet/outlet. The solution was placed under nitrogen, and 5% Pd-
15 C (0.96 g) were added with stirring. Ammonium formate (3.4 g, 55 mmol) was added and the reaction stirred at room temperature for 2 hours. Carbon dioxide evolution was immediately observed. The reaction solution was filtered, and bulk filtrate solvent was removed *via* rotary evaporator. The resulting viscous oil was dissolved in diethyl ether (150 mL), washed with
20 distilled H₂O (150 mL), isolated and dried over MgSO₄ anhyd. Solvent was removed *in vacuo* to yield the diamine as a sticky tan oil, which exhibited acceptable ¹H NMR and IR spectra (3.9 g, 84%).

Maleic anhydride (0.5 g, 5.1 mmol) was dissolved in acetone (10 mL) in a 250 mL three-necked flask equipped with magnetic stirring, addition
25 funnel and nitrogen inlet/outlet. The solution was cooled on an ice bath and placed under nitrogen. The addition funnel was charged with an acetone (10mL) solution of the diamine described above (2.0 g, 2.60 mmol), which

was added dropwise over 30 minutes. The reaction was stirred for an additional 30 minutes on the ice bath, then allowed to warm to room temperature, and stirred for another 4 hours. To the resulting slurry was added acetic anhydride (Ac_2O) (1.54 mL, 160 mmol), triethyl amine (Et_3N) (0.23 mL, 1.63 mmol) and sodium acetate (NaOAc) (0.16 g, 1.9 mmol). The resulting slurry was heated to mild reflux for 5 hours. The reaction was allowed to cool to room temperature, and solvent removed via rotary evaporator to yield a brown oil. This material was dissolved in CH_2Cl_2 (250 mL) and washed with distilled H_2O (200 mL), satd. NaHCO_3 (200 mL) and distilled H_2O (200 mL). Emulsions were broken by adding NaCl when necessary. The organic layer was isolated, dried over MgSO_4 anhyd. and solvent removed *in vacuo* to yield the bismaleimide, a brown solid (2.0 g, 83%). The resin exhibited satisfactory ^1H NMR, ^{13}C NMR and IR spectra, which indicated slight contamination with acetic acid.

15

EXAMPLE 2

Preparation of 20-Bismaleimido-10,11-dioctyl-eicosame (and isomers)

20

In a 5 L multi-neck flask equipped with a drying tube, thermometer, slow addition funnel, mechanical stirrer and nitrogen purge maleic anhydride (98.06 g, 1.02 equivalents on $-\text{NH}_2$) was dissolved in 500 ml tetrahydrofuran (THF). Stirring was begun and the solution was chilled with a dry ice/water bath. Slow addition of dimer diamine (Versamine 552, Henkel, 245.03 g, 0.4477 mol) in 250 ml THF was begun. Addition was carried out over 1 hour.

25

This Sheet Has Been Replaced

After addition was complete the ice bath was removed and 375 ml of THF was rinsed through the slow addition funnel to incorporate solidified diamine. After one hour the ice bath was replaced around the flask. 1-Hydroxybenzotriazole (96.79 g, 0.80 equivalents on $-NH_2$) was added rinsing into the flask with 50ml THF. When the temperature had reached 5°C slow addition of dicyclohexylcarbodiimide (DCC) (188.43 g, 1.02 equivalents on $-NH_2$) in 200ml THF was begun. The temperature during addition was kept below ten degrees. After DCC addition was complete the slow addition funnel was rinsed with 80 ml of THF. The ice bath was removed. The reaction was monitored by IR. When it appeared that the isoimide has been converted to maleimide (approximately 4 hours after the completion of DCC addition) the mixture was filtered, rinsing the solids with THF. The orange solution was placed in the freezer overnight.

The solution was removed from the freezer and allowed to warm to room temperature. Hydroquinone (0.0513 g) was added to the solution. A partial strip of the THF was carried out on a rotary evaporator with the temperature maintained below 28°C. The solution was concentrated to approximately 800 ml. Much particulate matter was visible. The solution was placed in freezer overnight.

The mixture was removed from the freezer and allowed to warm. The solids were filtered, rinsing with THF. The filtrate was transferred to a 2 L multi-neck flask equipped with a mechanical stirrer, vacuum line connected to a trap, and a glass tube attached by tubing to a drying tube. The remaining THF was stripped at room temperature by pulling a vacuum and bubbling air through the material while stirring. The resultant thick, creamy-tan colored semi-solid was placed in the freezer overnight.

This Sheet Has Been Replaced

The semi-solid was removed from the freezer and allowed to warm. The semi-solid was dissolved in 450 ml each of methanol and hexane, and washed with 50% methanol/water (4 x 250 ml) to remove 1-hydroxybenzotriazole (HOBt). It was attempted to extract the product with
5 hexane. After addition of 300 ml of hexane separation was not observed. The mixture was washed with additional water (3 x 250 ml). The organic phase was placed in the freezer overnight.

The material was removed from the freezer. Two layers were apparent. The upper layer was clear and yellow in color. The bottom layer
10 was a orange and cloudy. The material was poured cold into a separatory funnel. The top layer was hexane and the desired product. The bottom layer was extracted with hexane (6 x 200 ml), separation occurred easily. The combined extracts were dried over anhydrous magnesium sulfate and filtered, rinsing the solids with hexane. The solvent was stripped to an approximate
15 volume of 750 ml on a rotary evaporator with the temperature not exceeding 24°C. The remaining solvent was stripped off using a vacuum/air bubbling set-up at room temperature to give the desired product in 67% yield.

EXAMPLE 3

Preparation of Butadiene-Acrylonitrile Bismaleimide

5

Amino-terminated butadiene-acrylonitrile (sold as Hycar resin 1300 X42 ATBN by BF Goodrich, in which the m and n depicted in the structure are integers to provide a number average molecular weight of 3600) (450 g, 500 mmol based on amine equivalent weight $\text{AEW} = 450\text{g}$) was dissolved in CHCl_3 (1000 mL) in a 3 L four-necked flask equipped with addition funnel, mechanical stirrer, internal temperature probe and nitrogen inlet/outlet. The stirred solution was placed under nitrogen and cooled on an ice bath. The addition funnel was charged with maleic anhydride (98.1 g, 1 mol) in CHCl_3 (50 mL) and this solution was added to the reaction over 30 minutes, maintaining the internal reaction temperature below 10°C . This mixture was stirred for 30 minutes on ice, then allowed to warm to room temperature and stirred for an additional 4 hours. To the resulting slurry was added acetic anhydride (Ac_2O) (653.4 g, 6 mol), triethylamine (Et_3N) (64.8 g, 0.64 mol) and sodium acetate (NaOAc) (62.3 g, 0.76 mol). The reaction was heated to mild

20

This Sheet Has Been Replaced

reflux for 5 hours, allowed to cool to room temperature, and subsequently extracted with H₂O (1 L), satd. NaHCO₃ (1 L) and H₂O (2x1 L). Solvent was removed *in vacuo* to yield the maleimide terminated butadiene acrylonitrile.

5

EXAMPLE 4

Preparation of Tris(maleimide) Derived From Tris(epoxypropyl)isocyanurate

10

Tris(epoxypropyl)isocyanurate (99.0 g, 0.33 mol) is dissolved in THF (500mL) in a 2 L three-necked flask equipped with mechanical stirrer, internal temperature probe and nitrogen inlet/outlet. To this solution is added hydroxyphenylmaleimide (189.2 g, 1 mol) and benzyldimethylamine (1.4 g, 0.05 wt. %). The solution is heated to 80°C for 7 hours. The reaction then is allowed to cool to room temperature, is filtered, and the filtrant washed with 5

This Sheet Has Been Replaced

% HCl_{aq} (500mL) and distilled H₂O (1 L). The resulting solid, triazinetrakis(maleimide), is vacuum dried at room temperature.

EXAMPLE 5

5

Preparation of Maleimidoethylpalmitate

- Palmitoyl chloride (274.9 g, 1 mol) is dissolved in Et₂O (500 mL) in a 2 L three-necked flask equipped with mechanical stirrer, internal temperature probe, addition funnel and nitrogen inlet/outlet. NaHCO₃ (84.0 g, 1 mol) in distilled H₂O (500 mL) is added with vigorous stirring and the solution cooled on an ice bath under nitrogen. The addition funnel is charged with hydroxyethylmaleimide (141 g, 1 mol) in Et₂O (100 mL) and this solution added to the reaction over a period of 30 minutes, maintaining an internal
- 15 T < 10°C during the addition. The reaction is stirred for another 30 minutes on ice, then allowed to warm to room temperature and stirred for 4 hours. The reaction is transferred to a separatory funnel and the isolated organic layer washed with distilled H₂O (500 mL), 5% HCl_{aq} (500 mL) and distilled H₂O (2x500 mL). The organics are isolated, dried over MgSO₄ anhyd., filtered and
- 20 solvent removed *in vacuo* to yield the aliphatic maleimide.

EXAMPLE 6

Preparation of Bismaleimide Derived from 5-Isocyanato-1-(isocyanatomethyl)- 1, 3, 3-trimethylcyclohexane

5

5-Isocyanato-1-(isocyanatomethyl)-1, 3, 3-trimethylcyclohexane

111.15 g, 0.5 mol) is solvated in THF (500 mL) in a 1 L three-necked flask equipped with mechanical stirrer, addition funnel and nitrogen inlet/outlet.

The reaction is placed under nitrogen, and dibutyltin dilaurate (cat. Sn^{II})

- 10 (6.31g, 10 mmol) and hydroxyethylmaleimide (141 g, 1 mol) are added with stirring, and the resulting mixture heated for 4 hours at 70°C. The addition funnel is charged with hydroxyethylmaleimide (141 g, 1 mol) dissolved in THF (100 mL). This solution is added to the isocyanate solution over 30 minutes, and the resulting mixture heated for an additional 4 hours at 70°C.
- 15 The reaction is allowed to cool to room temperature and solvent removed *in vacuo*. The remaining oil is dissolved in CH₂Cl₂ (1 L) and washed with 10% HCl_{aq} (1 L) and distilled H₂O (2x1 L). The isolated organics are dried over MgSO₄, filtered and the solvent removed *in vacuo* to yield the maleimide.

EXAMPLE 7

Preparation of Dimer Divinyl Ether Derived From Pripol 2033

5

"Dimer Divinyl Ether" (and cyclic isomers)

Bis(1, 10-phenanthroline)Pd(OAc)₂ (0.21 g, 0.54 mmol) was dissolved in a mixture of butyl vinyl ether (8.18 g, 81.7 mmols), heptane (100 mL) and "dimer diol" (sold as Pripol 2033 by Unichema, 15.4 g, 27.2 mmol) in 2 L three-necked flask equipped with a mechanical stirrer under nitrogen. This solution was heated to light reflux for 6 h. The solution was allowed to cool to room temperature and subsequently poured onto activated carbon (20 g) and stirred for 1 hour. The resulting slurry was filtered, and excess butyl vinyl ether and heptane were removed *in vacuo* to yield the divinyl ether as a yellow oil. The product exhibited acceptable ¹H NMR, FT-IR and ¹³C NMR spectral characteristics. Typical viscosity ~100 cPs.

EXAMPLE 8

Preparation of Dimer Diacrylate Derived From Dimer Diol (Pripol 2033)

5

- Dimer diol (sold as Pripol 2033 by Unichema, 284.4 g, 500 mmol) is dissolved in dry acetone (500 mL) in a 1 L three-necked flask equipped with
- 10 mechanical stirrer, addition funnel and internal temperature probe under nitrogen. Triethylamine (101.2 g, 1 mol) is added to this solution and the solution cooled to 4°C on an ice bath. Acryloyl chloride (90.5 g, 1 mol) solvated in dry acetone (100 mL) is charged into the addition funnel and added to the stirred reaction solution over the course of 60 minutes,
- 15 maintaining an internal temperature <10°C. This solution is stirred on ice for an additional 2 hours, then allowed to warm to room temperature and stirred for 4 hours. Bulk solvent is removed *via* a rotary evaporator, and the remaining residue solvated in CH₂Cl₂ (1 L). This solution is washed with 5% HCl_{aq} (800 mL), and H₂O (2x800mL). The isolated organics are dried over
- 20 MgSO₄ anhyd. and filtered, and the solvent removed *in vacuo* to yield the diacrylate as an oil.

EXAMPLE 9

Preparation of N-ethylphenyl Maleimide

- 25 4-Ethyl aniline (12.12g) was dissolved in 50 ml of anhydrous ethyl ether and slowly added to a stirred solution of 9.81 g of maleic anhydride in

This Sheet Has Been Replaced

100 ml of anhydrous ethyl ether chilled in an ice bath. After completion of the addition, the reaction mixture was stirred for 30 minutes. The light yellow crystals were filtered and dried. Acetic anhydride (200 ml) was used to dissolve the maleamic acid and 20 g of sodium acetate. The reaction mixture was heated in an oil bath at 160°C. After 3 hours of reflux, the solution was cooled to room temperature, placed in a 1L beaker in ice water and stirred vigorously for 1 hour. The product was suction-filtered and recrystallized in hexane. The collected crystalline material was dried at 50°C in a vacuum oven overnight. FTIR and NMR analysis showed the characteristics of ethyl maleimide.

EXAMPLE 10

Preparation of Bis(alkenylsulfide)

Dimer acid (sold under the trademark Empol 1024 by Unichema)

20 (574.6 g, 1 mol) and propargyl alcohol (112.1 g, 2 mol) are solvated in toluene (1 L) in a 3 L three-necked flask equipped with mechanical stirring and a

This Sheet Has Been Replaced

Dean-Stark distillation apparatus. Concentrated H_2SO_4 (6 mL) is added and the solution is refluxed for 6 hours until 36 mL of H_2O is azeotropically distilled. The solution is allowed to cool to room temperature, washed with H_2O (2X1L), dried over MgSO_4 anhyd. and solvent removed *in vacuo* to yield the propargyl ester intermediate as an oil.

This ester intermediate (650.7 g, 1 mol) is solvated in THF (200 mL) in a 1L three-necked flask equipped with reflux condensor, mechanical stirrer and internal temperature probe under nitrogen. Lauryl mercaptan (404.8 g, 2 mol) and 2,2'-azobis(2,4-dimethylpentanenitrile) (sold under the trademark Vazo 52 by DuPont) (11 g) were added and the resulting mixture heated to 70°C on an oil bath with stirring for 7 hours. The reaction is allowed to cool to room temperature and solvent removed *in vacuo* to yield the alkenyl sulfide as an oil.

EXAMPLE A.

Preparation of 6-maleimidocaproic acid

6-maleimidocaproic acid

The acid functional maleimide, 6-maleimidocaproic acid, was synthesized using known methodology.¹ Aminocaproic acid (100 g, 7.6×10^{-1} mols) was dissolved in glacial acetic acid (50 mL) in a 500 mL four-necked flask equipped with mechanical stirring, an internal temperature probe and an addition funnel. The addition funnel was charged with a solution of maleic anhydride (74.8 g, 7.6×10^{-1} mols) dissolved in acetonitrile (75 mL). This

This Sheet Has Been Replaced

solution was added to the aminocaproic acid at room temperature dropwise over 1 hour, maintaining an internal reaction temperature less than 35°C. The reaction was stirred for three hours after the addition was complete. The reaction slurry was filtered, and the isolated filtrate was dried in a vacuum oven (P-25 T) overnight at 70°C to yield 166 g of off white solid (95%). The product amic acid exhibited FT-IR and ¹H NMR spectral characteristics consistent with literature data.

The amic acid described above (166 g, 7.2×10^{-1} moles) was solvated in a solution of toluene (200 mL), benzene (200 mL) and triethylamine (211 mL, 1.51 mol) in a 1 L three-necked flask equipped with mechanical stirring and a Dean-Stark trap under nitrogen. This solution was heated to reflux for 4 h and the water produced collected in the Dean-Stark trap. Distilled water (400 mL) was added to the reaction flask to dissolve the triethylammonium salt of the product which largely separated from the bulk solution during the reaction. This aqueous layer was isolated, acidified to pH~1 with 50% HCl, and extracted with ethyl acetate (600 mL). This organic layer was washed with distilled water (400 mL). The isolated organic layer was dried over MgSO₄, followed by solvent removal *in vacuo* to yield an off white solid (76.2 g, 50%). The product 6-maleimidocaproic acid was spectrographically identical to literature material by FT-IR and ¹H NMR.

EXAMPLE B.

Preparation of "Dimer Diester Bismaleimide"

"Dimer Diester Bismaleimide" (and cyclic isomers)

- 5 Pripol 2033 ("dimer diol", Uniqema, 92.4 g, 1.69×10^{-1} mols), 6-maleimidocaproic acid (75.0 g, 3.55×10^{-1} mols) and H_2SO_4 (0.50 mL, $\sim 8.5 \times 10^{-3}$ mols) were slurried in toluene (300 mL) in a 1 L four-necked flask equipped with mechanical stirrer, a Dean-Stark trap and an internal temperature probe under nitrogen. The reaction was heated to light reflux for
- 10 two hours and the water evolved collected in the Dean-Stark trap. The trap was drained and ~ 50 mL of toluene solvent was distilled off of the reaction to remove trace moisture and drive the esterification equilibrium to completion. The reaction was allowed to cool to room temperature, additional toluene (100 mL) was added (on the laboratory scale it is preferable to add diethyl ether in
- 15 place of toluene at this point), and the solution was washed with saturated NaHCO_3 aq. (300 mL) and distilled water (300 mL). The organic layer was isolated and dried over anhydrous MgSO_4 , and the solvent removed *in vacuo* to yield an orange oil (107.2 g, 68%). The material can be further purified by eluting a toluene solution of the resin through a short plug of silica or alumina.
- 20 This liquid bismaleimide resin exhibited acceptable FT-IR, ^1H NMR, and ^{13}C NMR data. Typical $\eta \sim 2500$ cPs.

This Sheet Has Been Replaced

EXAMPLE C.

Preparation of "Decane Diol Diester Bismaleimide"

"Decane Diol Diester Bismaleimide"

- 5 The general procedure described in Example B. was applied substituting decane diol (29.5 g, 1.69×10^{-1} mols) for Pripol 2033. This process yielded a solid, moderately soluble bismaleimide (54.9 g, 58%). The product exhibited satisfactory FT-IR and ^1H NMR data.

10

EXAMPLE D

Preparation of "Glycerol Triester Tris(maleimide)"

"Glycerol Triester Tris(maleimide)"

- The protocol outlined in example B. was utilized substituting glycerol
15 (10.4 g, 1.13×10^{-1} mol) for Pripol 2033. The product was a viscous liquid which exhibited acceptable FT-IR and ^1H NMR data.

This Sheet Has Been Replaced

EXAMPLE E.

Preparation of "Bis(*m*-nitrobenzyl carbamate) of IPDI"

5

"Bis(*m*-nitrobenzyl carbamate) of IPDI"

Isophorone diisocyanate ("IPDI", 100.0 g, 4.5×10^{-1} mols), *m*-nitrobenzyl alcohol (137.8 g, 9.0×10^{-1} mols) and dibutyl tin dilaurate (2.8 g, 4.5×10^{-3} mols) were solvated in dry toluene (1500 mL) in a 2L three-necked flask equipped with mechanical stirrer, reflux condensor and internal temperature probe under nitrogen. The resulting solution was heated to 90°C for 4 h. No isocyanate band was observed in the IR of the solids portion of the sample. The solution was allowed to cool to room temperature and washed with distilled H₂O (100 mL). The organic layer was isolated and solvent removed *in vacuo* to yield a yellow liquid which exhibited acceptable FT-IR and ¹H NMR characteristics.

This Sheet Has Been Replaced

EXAMPLE F.

Preparation of "Bis(*m*-aminobenzyl carbamate) of IPDI"

"Bis(*m*-aminobenzyl carbamate) of IPDI"

- 5 The dinitro compound from Example E. (8.28 g, 1.57×10^{-2} mols) was dissolved in ethanol (100 mL) in a 500 mL three-necked round bottom flask equipped with magnetic stirring under nitrogen. Cyclohexene (28.6 mL, 2.82×10^{-1} mols) was added, followed by 5% Pd/C (4.14 g). The resulting slurry was refluxed lightly for 6.5 h. The FT-IR of a filtered aliquot of this
- 10 solution exhibited no nitro stretching bands at 1529 cm^{-1} and 1352 cm^{-1} . The bulk solution was allowed to cool to room temperature and filtered. Solvent was removed *in vacuo* to yield a yellow semisolid (6.6 g, 90%) which exhibited acceptable FT-IR and ^1H NMR spectral characteristics.

15

EXAMPLE G.

This Sheet Has Been Replaced

Preparation of "Bis(*m*-maleimidobenzyl carbamate) of IPDI"

"Bis(*m*-maleimidobenzyl carbamate) of IPDI"

- The diamine from Example F (6.6 g, 1.41×10^{-2} mols) was solvated in
- 5 acetone (60 mL) in a 250 mL four-necked flask equipped with magnetic stirrer and addition funnel under nitrogen and cooled to 4°C. Maleic anhydride (2.76 g, 2.82×10^{-2} mols) dissolved in acetone (20 mL) was added over the course of 30 minutes. The resulting solution was stirred at 4°C for 1 h, and subsequently was allowed to warm to room temperature and stirred overnight.
- 10 FT-IR analysis indicated no maleic anhydride remained as judged by the absence of the anhydride stretching band at $\sim 1810 \text{ cm}^{-1}$.

- To the above amic acid solution was added acetic anhydride (8.5 mL, 9.0×10^{-2} mols), triethylamine (1.26 mL, 9.0×10^{-3} mols) and sodium acetate (0.88 g, 1.1×10^{-2} mols). The resulting solution was refluxed lightly for 4 h
- 15 under nitrogen. The reaction was allowed to cool to room temperature and bulk solvent was removed *in vacuo*. The resulting viscous liquid was resolvated in methylene chloride (200 mL) and extracted with distilled water (3x200 mL). The organics were then dried over MgSO_4 anhyd., filtered and solvent removed *in vacuo* to yield a light brown solid (6.75 g, 76%). This
- 20 material exhibited acceptable FT-IR and ^1H NMR spectral features.

This Sheet Has Been Replaced

EXAMPLE H.

Preparation of "Bis(m-nitrobenzyl carbamate) of DDI 1410"

"Bis(m-nitrobenzyl carbamate) of DDI 1410" (and cyclic isomers)

- 5 DDI 1410 (Henkel, "Dimer Diisocyanate", 99.77 g, 1.65×10^{-1} mols
based on 13.96 % NCO), *m*-nitrobenzyl alcohol (50.8 g, 3.32×10^{-1} mols) and
dibutyltin dilaurate (0.5 mL, 8.3×10^{-4} mols) were solvated in toluene (150 mL)
in a 1 L four-necked flask equipped with mechanical stirrer, reflux condensor
and internal temperature probe under nitrogen. The reaction was heated to
10 85°C for 2.5 h. FT-IR analysis of an aliquot of the reaction indicated complete
consumption of isocyanate functionality as judged by the lack of a band at
2272 cm^{-1} . Solvent was removed from the reaction in vacuo to yield a yellow
oil which solidified upon standing at room temperature (152.4 g, 102% (trace
toluene)). This solid exhibited satisfactory FT-IR and ^1H NMR spectral
15 features.

This Sheet Has Been Replaced

EXAMPLE I.

Preparation of "Bis(*m*-aminobenzyl carbamate) of DDI 1410"

"Bis(*m*-aminobenzyl carbamate) of DDI 1410" (and cyclic isomers)

- 5 The diamine product of Example H (39.6 g, 4.32×10^{-2} mols) and stannous chloride dihydrate (97.55 g, 4.32×10^{-1} mols) were slurried in ethyl acetate (300 mL) in a 1L three-necked flask equipped with mechanical stirrer and a reflux condensor under nitrogen. The reaction was heated to light reflux and stirred vigorously for 3 h. The solution was allowed to cool to room
- 10 temperature and brought to pH 7-8 with a solution of saturated sodium bicarbonate. The mixture was pushed through a 25 micron filter to yield a mixture which separated into a cloudy aqueous layer and a moderately clear organic layer. The aqueous layer was isolated and washed with ethyl acetate (100 mL). The organic layers were combined, washed with distilled water
- 15 (300 mL) and dried over anhydrous MgSO_4 . The slurry was filtered and solvent removed from the filtrate *in vacuo* to yield yellow, sticky solid (33.8 g, 92%).

EXAMPLE J.

Preparation of "Bis(*m*-maleimidobenzyl carbamate) of DDI 1410"

"Bis(*m*-maleimidobenzyl carbamate) of DDI 1410" (and cyclic isomers)

5 Maleic anhydride (15.4 g, 1.57×10^{-2} moles) was dissolved in acetone (300 mL) in a 2 L four-necked flask equipped with mechanical stirrer, internal temperature probe and addition funnel under nitrogen. This solution was cooled to -4°C on an ice bath. A solution of the diamine prepared in Example I (63.4 g, 7.48×10^{-2} moles) in acetone (70 mL) was charged to the addition
10 funnel and added to the maleic anhydride solution over a period of 30 minutes maintaining an internal temperature of $<10^{\circ}\text{C}$. The resulting solution was stirred for 1 h and subsequently allowed to warm to room temperature and stir for 2 h.

To this solution of amic acid was added acetic anhydride (24.7 mL, 2.62×10^{-1} moles), triethylamine (6.25 mL, 4.48×10^{-2} moles) and manganese acetate tetrahydrate (0.37 g, 1.50×10^{-3} moles). This solution was heated to light reflux for 6.5 h, then allowed to cool to room temperature. Bulk solvent was removed *in vacuo*, and the resulting dark liquid was dissolved in diethyl ether (500 mL). This solution was washed with dist. H_2O (500 mL). The
20 isolated organic layer was then washed with saturated NaHCO_3 aq. (500 mL)

and again with dist. H₂O (500 mL). The organics were isolated, dried over anhyd. MgSO₄, and solvent removed *in vacuo* to yield a viscous orange oil. This material exhibited FT-IR, ¹H NMR and ¹³C NMR spectral features consistent with the expected bismaleimide product.

- 5 Another embodiment of this invention includes the method in which the vinyl compounds having the formulae [M-X_m]_n-Q and [M-Z_m]_n-K as described herein will have moieties Q and Z that can be an ester having the structure

- 10 or the structure

in which p is 1 to 100,

each R³ can independently be an alkyl or alkyloxy chain having up to 100 atoms in the chain, which chain may contain aryl substituents, or

- 15 a siloxane having the structure $-(CR^1_2)_e-[SiR^4_2-O]_f-SiR^4_2-(CR^1_2)_g-$ in which the R¹ substituent independently for each position is H or an alkyl group having 1 to 5 carbon atoms, the R⁴ substituent independently for each position is an alkyl group having 1 to 5 carbon atoms or an aryl group, e and g are independently 1 to 10 and f is 1 to 50.

- 20 Another embodiment of this invention includes the method in which the vinyl compounds having the structures:

and

This Sheet Has Been Replaced

as described herein will have moieties Q and Z that can be an ester having the structure

or the structure

in which p is 1 to 100,

each R^3 can independently be an alkyl or alkyloxy chain having up to 100 atoms in the chain, which chain may contain aryl substituents, or

a siloxane having the structure $-(CR^1_2)_e-[SiR^4_2-O]_f-SiR^4_2-(CR^1_2)_g-$

10 in which the R^1 substituent independently for each position is H or an alkyl group having 1 to 5 carbon atoms, the R^4 substituent independently for each position is an alkyl group having 1 to 5 carbon atoms or an aryl group, e and g are independently 1 to 10 and f is 1 to 50;

and the moiety B representing C, S, N, O, C(O), C(O)NH or

15 C(O)N(R^6), in which R^6 is C_1 to C_3 alkyl.

Another embodiment of this invention includes the curable adhesive composition as described herein containing an anionic or cationic curing initiator. The types and useful amounts of such initiators are well known in the art.

20 Other embodiments of this invention include those in the following numbered paragraphs:

1. A method for making an electronic component adhered to a substrate with a cured reworkable adhesive composition comprising the steps of:

This Sheet Has Been Replaced

- (a) providing a curable reworkable adhesive composition comprising
- (i) one or more mono-functional vinyl compounds in a major amount effective to provide thermoplastic properties, and
 - (ii) optionally, one or more poly-functional vinyl compounds in a minor amount ineffective to diminish the thermoplastic properties of the cured composition,
 - (iii) a curing initiator selected from the group consisting of a free-radical initiator, a photoinitiator, and a combination of those,
 - (iv) optionally, one or more fillers;
 - (v) optionally, one or more adhesion promoters;
- (b) applying the curable reworkable adhesive composition to either the electronic component or the substrate
- (c) contacting the electronic component and the substrate together;
- and
- (d) curing the composition *in situ*.

2. The method according paragraph 1 in which the vinyl compound has the formula $[M-X]_n - Q$ in which m is 0 or 1, n is 1, and

- (a) M is a maleimide moiety having the structure:

in which R¹ is H or an alkyl group having 1 to 5 carbon atoms;

- (b) X is an aromatic group selected from the group of aromatic groups having the structures:

25 having the structure:

This Sheet Has Been Replaced

in which

p is 1 to 100, and

each R³ can independently be an alkyl or alkyloxy chain having up to
 5 100 atoms in the chain, which chain may contain aryl substituents; or

each R³ can independently be a siloxane having the structure —
 (CR¹₂)_e—[SiR⁴₂—O]_f—SiR⁴₂—(CR¹₂)_g— in which the R¹ substituent independently
 for each position is H or an alkyl group having 1 to 5 carbon atoms, the R⁴
 substituent independently for each position is an alkyl group having 1 to 5
 10 carbon atoms or an aryl group, e and g are independently 1 to 10, and f is 1 to
 50.

26. The method according to paragraph 1 in which the vinyl
 compound has the formula

(a) R¹ and R² are H or an alkyl group having 1 to 5 carbon atoms, or
 together form a 5 to 9 membered ring with the carbons forming the vinyl
 group;

(b) B is C, S, N, O, C(O), C(O)NH or C(O)N(R^a), in which R^a is an
 20 alkyl group having 1 to 5 carbon atoms;

(c) K is an aromatic group selected from the group of aromatic
 groups having the structures:

This Sheet Has Been Replaced

(V)

(VI)

in which p is 1 to 100;

(VII)

in which p is 1 to 100;

10 (VIII)

(IX)

in which R⁵, R⁶, and R⁷ are a linear or branched

15 chain alkyl, alkyloxy, alkyl amine, alkyl sulfide, alkylene, alkyleneoxy, alkylene amine, alkylene sulfide, aryl, aryloxy, or aryl sulfide species, which may contain saturated or unsaturated cyclic or heterocyclic substituents pendant

This Sheet Has Been Replaced

from the chain or as part of the backbone in the chain, and in which any heteratom present may or may not be directly attached to the aromatic ring; or

R^5 , R^6 , and R^7 are a siloxane having the structure

$-(CR^1_2)_e-[SiR^4_2-O]_f-SiR^4_2-(CH_3)_g-$ in which the R^1 substituent is H or an

5 alkyl group having 1 to 5 carbon atoms and the R^4 substituent independently for each position is an alkyl group having 1 to 5 carbon atoms or an aryl group, and e is 1 to 10 and f is 1 to 50;

(X)

10

(XI)

and (XII)

15

and

(d) Z is a linear or branched chain alkyl, alkyloxy, alkyl amine, alkyl sulfide, alkylene, alkyleneoxy, alkylene amine, alkylene sulfide, aryl,

This Sheet Has Been Replaced

aryloxy, or aryl sulfide species, which may contain saturated or unsaturated cyclic or heterocyclic substituents pendant from the chain or as part of the chain, and in which any heteratom present may or may not be directly attached to X.

5

27. The method according to paragraph 26 in which Z is a linear or branched chain alkyl, alkyloxy, alkylene, or alkyleneoxy species, which may contain saturated or unsaturated cyclic or heterocyclic substituents pendant from the chain or as part of the chain.

10

28. The method according to paragraph 26 in which Z is a linear or branched chain alkyl species, which may contain saturated or unsaturated cyclic or heterocyclic substituents pendant from the chain or as part of the chain.

15

29. The method according to paragraph 26 in which Z is a urethane having the structure:

20 in which each R^2 independently is an alkyl, aryl, or arylalkyl group having 1 to 18 carbon atoms; R^3 is an alkyl or alkyloxy chain having up to 100 atoms in the chain, which chain may contain aryl substituents; X is O, S, N, or P; and v is 0 to 50.

25

30. The method according to paragraph 26 in which Z is an ester having the structure:

This Sheet Has Been Replaced

in which R^3 is an alkyl or alkyloxy chain having up to 100 atoms in the chain, which chain may contain aryl substituents.

- 5 31. The method according to paragraph 26 in which Z is an ester having the structure:

in which

p is 1 to 100, and

- 10 each R^3 can independently be an alkyl or alkyloxy chain having up to 100 atoms in the chain, which chain may contain aryl substituents; or

each R^3 can independently be a siloxane having the structure —

$(CR^1_2)_e-[SiR^4_2-O]_f-SiR^4_2-(CR^1_2)_g-$ in which the R^1 substituent independently

for each position is H or an alkyl group having 1 to 5 carbon atoms, the R^4

- 15 substituent independently for each position is an alkyl group having 1 to 5 carbon atoms or an aryl group, e and g are independently 1 to 10, and f is 1 to 50.

- 20 32. The method according to paragraph 26 in which Z is an ester having the structure:

in which p is 1 to 100, and

each R^3 can independently be an alkyl or alkyloxy chain having up to 100 atoms in the chain, which chain may contain aryl substituents; or

each R^3 can independently be a siloxane having the structure —
 $(CR^1_2)_e-[SiR^4_2-O]_f-SiR^4_2-(CR^1_2)_g-$ in which the R^1 substituent independently
 for each position is H or an alkyl group having 1 to 5 carbon atoms, the R^4
 substituent independently for each position is an alkyl group having 1 to 5
 5 carbon atoms or an aryl group, e and g are independently 1 to 10, and f is 1 to
 50.

33. The method according to any one of paragraphs 26 to 32 in
 which K is

when p is 1 to 100.

34. The method according to any one of paragraphs 26 to 32 in
 which K is

in which R^5 , R^6 , and R^7 are a linear or branched
 15 chain alkyl, alkyloxy, alkyl amine, alkyl sulfide, alkylene, alkyleneoxy, alkylene
 amine, alkylene sulfide, aryl, aryloxy, or aryl sulfide species, which may
 contain saturated or unsaturated cyclic or heterocyclic substituents pendant
 from the chain or as part of the chain, and in which any heteroatom present
 may or may not be directly attached to the aromatic ring.

20

35. The method according to any one of paragraphs 26 to 32 in
 which K is

This Sheet Has Been Replaced

36. The method according to any one of the preceding paragraphs in which the curing initiator is an anionic or cationic curing
5 initiator.

37. An electronic assembly prepared by the method of any one of the preceding paragraphs.

What is claimed is:

1. A method for making an electronic component adhered to a substrate with a cured reworkable adhesive composition comprising the steps of:
 - 5 (a) providing a curable reworkable adhesive composition comprising
 - (i) one or more mono-functional vinyl compounds in a major amount effective to provide thermoplastic properties, and
 - (ii) optionally, one or more poly-functional vinyl compounds in a minor amount ineffective to diminish the thermoplastic properties
 - 10 of the cured composition,
 - (iii) a curing initiator selected from the group consisting of a free-radical initiator, a photoinitiator, and a combination of those,
 - (iv) optionally, one or more fillers;
 - (v) optionally, one or more adhesion promoters;
 - 15 (b) applying the curable reworkable adhesive composition to either the electronic component or the substrate
 - (c) contacting the electronic component and the substrate together; and
 - (d) curing the composition *in situ*.
- 20 2. The method according claim 1 in which the vinyl compound has the formula $[M-X_m]_n - Q$ in which m is 0 or 1, n is 1, and
 - (a) M is a maleimide moiety having the structure:

This Sheet Has Been Replaced

in which R¹ is H or an alkyl group having 1 to 5 carbon

atoms;

(b) X is an aromatic group selected from the group of aromatic groups having the structures:

5

(I)

(II)

(III)

and

(IV)

10

and

(c) Q is a linear or branched chain alkyl, alkyloxy, alkyl amine, alkyl sulfide, alkylene, alkyleneoxy, alkylene amine, alkylene sulfide, aryl, aryloxy, or aryl sulfide species, which may contain saturated or unsaturated cyclic or heterocyclic substituents pendant from the chain or as part of the chain, and in which any heteratom present may or may not be directly attached to X; or

15

(d) Q is a urethane having the structure:

in which each R² independently is an alkyl, aryl, or arylalkyl group having 1 to

20

18 carbon atoms; R³ is an alkyl or alkyloxy chain having up to 100 atoms in

This Sheet Has Been Replaced

the chain, which chain may contain aryl substituents; X is O, S, N, or P; and v is 0 to 50; or

(e) Q is an ester having the structure:

5 in which R³ is an alkyl or alkyloxy chain having up to 100 atoms in the chain, which chain may contain aryl substituents; or

(f) Q is an ester having the structure:

in which

10 p is 1 to 100, and

each R³ can independently be an alkyl or alkyloxy chain having up to 100 atoms in the chain, which chain may contain aryl substituents; or

each R³ can independently be a siloxane having the structure ---

(CR¹₂)_e---[SiR⁴₂---O]_f---SiR⁴₂---(CR¹₂)_g--- in which the R¹ substituent independently

15 for each position is H or an alkyl group having 1 to 5 carbon atoms, the R⁴ substituent independently for each position is an alkyl group having 1 to 5 carbon atoms or an aryl group, e and g are independently 1 to 10, and f is 1 to 50; or

(g) Q is an ester having the structure:

in which

p is 1 to 100, and

each R³ can independently be an alkyl or alkyloxy chain having up to 100 atoms in the chain, which chain may contain aryl substituents; or

This Sheet Has Been Replaced

each R^3 can independently be a siloxane having the structure —
 $(CR^1)_e-[SiR^4_2-O]_f-SiR^4_2-(CR^1)_g-$ in which the R^1 substituent independently
for each position is H or an alkyl group having 1 to 5 carbon atoms, the R^4
substituent independently for each position is an alkyl group having 1 to 5
5 carbon atoms or an aryl group, e and g are independently 1 to 10, and f is 1 to
50.

3. The method according claim 1 in which the vinyl compound
has the formula $[M-Z_m]_n-K$ in which m is 0 or 1, n is 1, and

10 (a) M is a maleimide moiety having the structure

in which R^1 is H or an alkyl having 1 to 5 carbon atoms;

(b) K is an aromatic group selected from group of aromatic
groups having the structures:

(V)

(VI)

in which p is 1 to 100;

This Sheet Has Been Replaced

(VII)

in which p is 1 to 100;

(VIII)

(IX)

in which R^5 , R^6 , and R^7 are a linear or branched chain alkyl, alkyloxy, alkyl amine, alkyl sulfide, alkylene, alkyleneoxy, alkylene amine, alkylene sulfide, aryl, aryloxy, or aryl sulfide species, which may contain saturated or unsaturated cyclic or heterocyclic substituents pendant from the chain or as part of the backbone in the chain, and in which any heteroatom present may or may not be directly attached to the aromatic ring;

or R^5 , R^6 , and R^7 are a siloxane having the structure

15 $-(CR^1_2)_e-[SiR^4_2-O]_f-SiR^4_2-(CH_3)_g-$ in which the R^1 substituent is H or an alkyl group having 1 to 5 carbon atoms and the R^4 substituent independently for each position is an alkyl group having 1 to 5 carbon atoms or an aryl group, and e is 1 to 10 and f is 1 to 50;

This Sheet Has Been Replaced

(X)

(XI)

5

(XII)

and

- 10 (c) Z is a linear or branched chain alkyl, alkyloxy, alkyl amine, alkyl sulfide, alkylene, alkyleneoxy, alkylene amine, alkylene sulfide, aryl, aryloxy, or aryl sulfide species, which may contain saturated or unsaturated cyclic or heterocyclic substituents pendant from the chain or as part of the chain, and in which any heteratom present may or may not be directly
- 15 attached to K; or

(d) Z is a urethane having the structure:

- in which each R^2 independently is an alkyl, aryl, or arylalkyl group having 1 to 18 carbon atoms; R^3 is an alkyl or alkyloxy chain having up to 100 atoms in the chain, which chain may contain aryl substituents; X is O, S, N, or P; and v is 0 to 50; or

(e) Z is an ester having the structure:

- in which R^3 is an alkyl or alkyloxy chain having up to 100 atoms in the chain, which chain may contain aryl substituents; or

(f) Z is an ester having the structure:

in which

- p is 1 to 100, and each R^3 can independently be an alkyl or alkyloxy chain having up to 100 atoms in the chain, which chain may contain aryl substituents; or each R^3 can independently be a siloxane having the structure — $(CR^1_2)_e-[SiR^4_2-O]_f-SiR^4_2-(CR^1_2)_g$ — in which the R^1 substituent independently for each position is H or an alkyl group having 1 to 5 carbon atoms, the R^4 substituent independently for each position is an alkyl group having 1 to 5 carbon atoms or an aryl group, e and g are independently 1 to 10, and f is 1 to 50; or

This Sheet Has Been Replaced.

(g) Z is an ester having the structure:

in which

p is 1 to 100, and

5 each R^3 can independently be an alkyl or alkyloxy chain having up to 100 atoms in the chain, which chain may contain aryl substituents; or

each R^3 can independently be a siloxane having the structure —

for each position is H or an alkyl group having 1 to 5 carbon atoms, the R^4

10 substituent independently for each position is an alkyl group having 1 to 5 carbon atoms or an aryl group, e and g are independently 1 to 10, and f is 1 to 50.

4. The method according to claim 2 or 3 in which K is

15

in which p is 1 to 100.

5. The method according to claim 2 or claim 3 in which K is

in which R^5 , R^6 , and R^7 are a linear or branched

chain alkyl, alkyloxy, alkyl amine, alkyl sulfide, alkylene, alkyleneoxy, alkylene

20 amine, alkylene sulfide, aryl, aryloxy, or aryl sulfide species, which may

contain saturated or unsaturated cyclic or heterocyclic substituents pendant

This Sheet Has Been Replaced

from the chain or as part of the chain, and in which any heteroatom present may or may not be directly attached to the aromatic ring.

6. The method according to claim 2 or claim 3 in which K is

7. The method according to claim 1 in which the vinyl compound has the formula

- 10 (a) R^1 and R^2 are H or an alkyl group having 1 to 5 carbon atoms, or together form a 5 to 9 membered ring with the carbons forming the vinyl group;
- (b) B is C, S, N, O, C(O), C(O)NH or C(O)N(R^8), in which R^8 is an alkyl group having 1 to 5 carbon atoms;
- 15 (c) X is an aromatic group selected from the group of aromatic groups having the structures:

(I)

(II)

(III)

and

This Sheet Has Been Replaced

(IV)

; and

- (d) Q is a linear or branched chain alkyl, alkyloxy, alkyl amine, alkyl sulfide, alkylene, alkyleneoxy, alkylene amine, alkylene sulfide, aryl, aryloxy, or aryl sulfide species, which may contain saturated or unsaturated cyclic or heterocyclic substituents pendant from the chain or as part of the chain, and in which any heteratom present may or may not be directly attached to X; or

(e) Q is a urethane having the structure:

in which each R^2 independently is an alkyl, aryl, or arylalkyl group having 1 to 18 carbon atoms; R^3 is an alkyl or alkyloxy chain having up to 100 atoms in the chain, which chain may contain aryl substituents; X is O, S, N, or P; and v is 0 to 50; or

- 15 (f) Q is an ester having the structure:

in which R^3 is an alkyl or alkyloxy chain having up to 100 atoms in the chain, which chain may contain aryl substituents; or

(g) Q is an ester having the structure:

in which

p is 1 to 100, and

This Sheet Has Been Replaced

each R^3 can independently be an alkyl or alkyloxy chain having up to 100 atoms in the chain, which chain may contain aryl substituents; or

each R^3 can independently be a siloxane having the structure —
 $(CR^1_2)_e-[SiR^4_2-O]_f-SiR^4_2-(CR^1_2)_g-$ in which the R^1 substituent independently
 5 for each position is H or an alkyl group having 1 to 5 carbon atoms, the R^4
 substituent independently for each position is an alkyl group having 1 to 5
 carbon atoms or an aryl group, e and g are independently 1 to 10, and f is 1 to
 50; or

(h) Q is an ester having the structure:

in which

p is 1 to 100, and

each R^3 can independently be an alkyl or alkyloxy chain having up to 100 atoms in the chain, which chain may contain aryl substituents; or

15 each R^3 can independently be a siloxane having the structure —
 $(CR^1_2)_e-[SiR^4_2-O]_f-SiR^4_2-(CR^1_2)_g-$ in which the R^1 substituent independently
 for each position is H or an alkyl group having 1 to 5 carbon atoms, the R^4
 substituent independently for each position is an alkyl group having 1 to 5
 carbon atoms or an aryl group, e and g are independently 1 to 10, and f is 1 to
 20 50.

8. The method according to claim 1 in which the vinyl compound has the formula

This Sheet Has Been Replaced

in which m is 0 or 1 and n is 1; and

(a) R^1 and R^2 are H or an alkyl group having 1 to 5 carbon atoms, or together form a 5 to 9 membered ring with the carbons forming the vinyl group;

5 (b) B is C, S, N, O, C(O), C(O)NH or C(O)N(R^6), in which R^6 is an alkyl group having 1 to 5 carbon atoms;

(c) K is an aromatic group selected from the group of aromatic groups having the structures:

(V)

(VI)

in which p is 1 to 100;

(VII)

in which p is 1 to 100;

15 (VIII)

(IX)

- in which R^5 , R^6 , and R^7 are a linear or branched chain alkyl, alkyloxy, alkyl amine, alkyl sulfide, alkylene, alkyleneoxy, alkylene amine, alkylene sulfide, aryl, aryloxy, or aryl sulfide species, which may
- 5 contain saturated or unsaturated cyclic or heterocyclic substituents pendant from the chain or as part of the backbone in the chain, and in which any heteratom present may or may not be directly attached to the aromatic ring; or

- R^5 , R^6 , and R^7 are a siloxane having the structure $-(CR^1_2)_e-[SiR^4_2-O]_f-SiR^4_2-(CH_3)_g-$ in which the R^1 substituent is H or an
- 10 alkyl group having 1 to 5 carbon atoms and the R^4 substituent independently for each position is an alkyl group having 1 to 5 carbon atoms or an aryl group, and e is 1 to 10 and f is 1 to 50;

(X)

15 (XI)

This Sheet Has Been Replaced

and (XII)

and

- (d) Z is a linear or branched chain alkyl, alkyloxy, alkyl amine, alkyl sulfide, alkylene, alkyleneoxy, alkylene amine, alkylene sulfide, aryl, aryloxy, or aryl sulfide species, which may contain saturated or unsaturated cyclic or heterocyclic substituents pendant from the chain or as part of the chain, and in which any heteratom present may or may not be directly attached to X; or

- 10 (e) Z is a urethane having the structure:

- in which each R^2 independently is an alkyl, aryl, or arylalkyl group having 1 to 18 carbon atoms; R^3 is an alkyl or alkyloxy chain having up to 100 atoms in the chain, which chain may contain aryl substituents; X is O, S, N, or P; and v is 0 to 50; or

- (f) Z is an ester having the structure:

- in which R^3 is an alkyl or alkyloxy chain having up to 100 atoms in the chain, which chain may contain aryl substituents; or

- (g) Z is an ester having the structure:

This Sheet Has Been Replaced

in which

p is 1 to 100, and

each R^3 can independently be an alkyl or alkyloxy chain having up to

5 100 atoms in the chain, which chain may contain aryl substituents; or

each R^3 can independently be a siloxane having the structure —

$(CR^1_2)_e-[SiR^4_2-O]_f-SiR^4_2-(CR^1_2)_g-$ in which the R^1 substituent independently

for each position is H or an alkyl group having 1 to 5 carbon atoms, the R^4

substituent independently for each position is an alkyl group having 1 to 5

10 carbon atoms or an aryl group, e and g are independently 1 to 10, and f is 1 to

50; or

(h) Z is an ester having the structure:

in which p is 1 to 100, and

15 each R^3 can independently be an alkyl or alkyloxy chain having up to

100 atoms in the chain, which chain may contain aryl substituents; or

each R^3 can independently be a siloxane having the structure —

$(CR^1_2)_e-[SiR^4_2-O]_f-SiR^4_2-(CR^1_2)_g-$ in which the R^1 substituent independently

for each position is H or an alkyl group having 1 to 5 carbon atoms, the R^4

20 substituent independently for each position is an alkyl group having 1 to 5

carbon atoms or an aryl group, e and g are independently 1 to 10, and f is 1 to

50.

9. The method according to claim 7 or claim 8 in which K is

when p is 1 to 100.

10. The method according to claim 7 or claim 8 in which K is

5

in which R⁵, R⁶, and R⁷ are a linear or branched

chain alkyl, alkyloxy, alkyl amine, alkyl sulfide, alkylene, alkyleneoxy, alkylene amine, alkylene sulfide, aryl, aryloxy, or aryl sulfide species, which may contain saturated or unsaturated cyclic or heterocyclic substituents pendant from the chain or as part of the chain, and in which any heteroatom present

- 10 may or may not be directly attached to the aromatic ring.

11. The method according to claim 7 or claim 8 in which K is

15

12. The method according to any one of the preceding claims in

which the curing initiator is an anionic or cationic curing initiator.

13. An electronic assembly prepared by the method of any one of the preceding claims.
