

ABSTRACT

The invention relates to area efficient realization of coefficient block [A] or architecture [A] with hardware sharing techniques and optimizations applied to this block. The block [A] is connected to coefficient lines CLin_0, CLin_1.....CLin_n and BLin_0, BLin_1,....BLin_n coming from block [E] and/or [F], to be connected to perform filtering operation or a mathematical computing operation with optimization in hardware and provides a zero latency output. The invention also gives the area minimal realization of digital filters based on coefficient block[A], when operated in bit serial fashion. The optimization techniques and structure of the present invention are good for linear digital filters typically a finite impulse response(FIR) filter, infinite impulse response filter(IIR) and for other filters and applications based on combinational logic consisting of delay element(T), multiplier(M), adder(SA) and subtractor (SS).
