ABSTRACT

Embodiments of the present disclosure provide an image scanning method and apparatus, and an electronic device. The image scanning method includes: obtaining a file to be detected in an image file; splitting the file to be detected into a plurality of batches and generating a scanning sub-task corresponding to each batch; for the scanning sub-task of each batch, triggering a computing unit to load a scanning rule corresponding to the scanning sub-task, and performing, according to the scanning rule, computation corresponding to the scanning sub-task, where the computing unit is implemented through a Function Compute (FC) service; and merging computation results corresponding to the scanning sub-tasks to obtain an image scanning result. The method of the present disclosure improves scanning performance and reduces scanning duration.
