

ABSTRACT

A water management system for cleansing water from
baths, showers and hand basins and supplying the cleansed
5 water to W.C.s. The water management system has a settling
chamber (9) with an overflow to a discharge chamber (10).
Associated with the lower part of the settling chamber (9)
is a means such as a fluidising unit (20) for removing the
heavier than water contaminants which have settled out in
10 the settling chamber (9). A separator such as a
hydrocyclone (4) may additionally be provided to remove
contaminants which are lighter than water from the water.
