(54) Title: SUPER HUB SYSTEM AND METHOD THEREOF

Fig. 4

(57) Abstract: A system includes at least two ports (22, 24, 26) connected to particular electronic products. The system is able to intelligently detect the master/slave status of the electronic device and establish connecting routes among the ports (22, 24, 26) and the system accordingly. Each of the connecting route transfers at least electric power and optionally data. The system alleviates users' concern whether the electronic product to be connected to the system acts as a master or a slave. As such, electronic products can be connected to any port (22, 24, 26) available in the system.
