

EQUIPMENT SERVER, DEVICE SERVER, COMMUNICATION SYSTEM, AND DATA STRUCTURE

Abstract

There are provided a communication system in which a piece of equipment in a facility and a device working in the facility cooperate easily with each other, an equipment server and a device server in the communication system, and a data structure which is to be communicated in the communication system. In a communication system (1), a message is used for control of a control target by being communicated in a common format between each of equipment servers (7) and each of object servers (9). The control target is a piece (3) of building equipment as a piece of equipment or an object (4) working in a building (2) as a facility. The message includes first information, second information, and third information. The first information is information for identification of the object (4) as each of devices. The second information is information representing a transmission direction of the message. The third information is information representing a process to be executed by the control target.
