Abstract

ELECTRIC COOKING DEVICE

An electric cooking device includes a tray (2) received in a base (1), a heater (25) attached to the tray (2), a casing (4) pivotally secured to the tray (2) at a pivot device, and a cover (3) secured to the casing (4). The food to be cooked may be solidly retained between the tray (2) and the casing (4) such that the oil and the steam and the oil vapor may be suitably retained within the tray (2) and the casing (4). Another heater may be secured to the casing for further heating the food contained in the tray. The casing may be adjusted relative to the tray for receiving various amount of food.
